Intro 3 — Descriptive statistics

Description Remarks and examples Also see

Description

In this entry, we introduce you to four helper commands that let you quickly see some basic attributes of your CM data: cmchoiceset, cmsample, cmtab, and cmsummarize.

Remarks and examples

stata.com

Remarks are presented under the following headings:

cmchoiceset: Tabulating choice sets

cmsample: Looking at problem observations

cmtab: Tabulating chosen alternatives versus other variables cmsummarize: Descriptive statistics for CM variables

cmchoiceset: Tabulating choice sets

Let's again use the data that we used in [CM] Intro 2.

- . use https://www.stata-press.com/data/r18/carchoice
 (Car choice data)
- . list consumerid car purchase gender income if consumerid <= 3,
- > sepby(consumerid) abbrev(10)

	consumerid	car	purchase	gender	income
1.	1	American	1	Male	46.7
2.	1	Japanese	0	Male	46.7
3.	1	European	0	Male	46.7
4.	1	Korean	0	Male	46.7
5.	2	American	1	Male	26.1
6.	2	Japanese	0	Male	26.1
7.	2	European	0	Male	26.1
8.	2	Korean	0	Male	26.1
9.	3	American	0	Male	32.7
10.	3	Japanese	1	Male	32.7
11.	3	European	0	Male	32.7

The case ID variable is consumerid. The alternatives variable is car. The 0/1 variable purchase indicates the nationality of car purchased. The variables gender and income are case-specific variables.

We cmset our data:

. cmset consumerid car

 ${\tt note:}\ {\tt alternatives}\ {\tt are}\ {\tt unbalanced}\ {\tt across}\ {\tt choice}\ {\tt sets};\ {\tt choice}\ {\tt sets}\ {\tt of}\ {\tt different}$

sizes found.

Case ID variable: consumerid

Alternatives variable: car

We use cmchoiceset to see the choice sets:

. cmchoiceset

Tabulation of choice-set possibilities

Choice set	Freq.	Percent	Cum.
1 2 3 1 2 3 4	380 505	42.94 57.06	42.94 100.00
Total	885	100.00	

Note: Total is number of cases.

. label list nation

nation:

- 1 American
- 2 Japanese
- 3 European
- 4 Korean

There are two choice sets, $\{1,2,3\}$ and $\{1,2,3,4\}$. The value label nation, which labels the alternatives variable car, shows the correspondence between the numerical values and the nationalities. One choice set includes all four nationalities, and the other includes all nationalities except Korean.

cmchoiceset can be used after a cm estimation command to see the choice sets in the estimation sample. Here we fit a model using cmclogit and then run cmchoiceset restricted to the estimation sample.

- . cmclogit purchase dealers, casevars(i.gender income)
 (output omitted)
- . cmchoiceset if e(sample)

Tabulation of choice-set possibilities

Cum.	Percent	Freq.	Choice set
43.27 100.00	43.27 56.73	373 489	1 2 3 1 2 3 4
	100.00	862	Total

Note: Total is number of cases.

We see that the estimation sample had 862 cases, whereas the earlier cmchoiceset output showed that the full sample had 885 cases.

By default, missing values are handled casewise, meaning that any missing value in any observation composing the case causes the entire case to be omitted from the estimation sample. In this example, 885 - 862 = 23 cases contained missing values.

If you want to omit only observations with missing values and not the entire case, specify the option altwise. We refit the model using the altwise option and look at the choice sets.

- . cmclogit purchase dealers, casevars(i.gender income) altwise $(output\ omitted)$
- . cmchoiceset if e(sample)

Tabulation of choice-set possibilities

Choice set	Freq.	Percent	Cum.
1 2	2	0.23	0.23
1 2 3	378	42.71	42.94
1 2 3 4	489	55.25	98.19
1 2 4	4	0.45	98.64
1 3	2	0.23	98.87
1 3 4	2	0.23	99.10
2 3	3	0.34	99.44
2 3 4	5	0.56	100.00
Total	885	100.00	

Note: Total is number of cases.

Handling the missing values alternativewise gives six new choice sets, albeit each with low frequency.

Handling missing values casewise never creates new choice sets. Handling missing values with altwise almost always changes the choice sets used in the estimation. You should be aware of the consequences. For instance, a dataset with balanced choice sets will typically become unbalanced when missing values are handled alternativewise. See example 3 in [CM] cmclogit for more details.

cmchoiceset also creates two-way (and three-way) tabulations. You can tabulate a variable, typically a case-specific one, against choice sets to see whether there is any association between the variable and choice sets. If you have panel data, you can tabulate the choice sets versus time to see whether choice sets change over time. See [CM] **cmchoiceset**.

cmchoiceset has a generate(newvar) option, which creates a variable with categories of the choice sets. This variable can be used in the over() option of margins to compute predicted probabilities and marginal effects separately for each choice set. See example 3 in [CM] cmchoiceset for an example.

cmsample: Looking at problem observations

Let's load and try to cmset a dataset to which we added some errors.

- . use $\label{lem:https://www.stata-press.com/data/r18/carchoice_errors, clear (Car choice data with errors)$
- . cmset consumerid car
- at least one choice set has more than one instance of the same alternative r(459);

We get an error and our data are not cmset. We need to fix the repeated alternatives in car, the alternatives variable. The cmsample command can locate these problem observations. But to run cmsample, the data must be cmset. To do this, we use cmset with the force option. (Note: cmsample is the only command that works after suppressing an error using cmset, force. All other cm commands will give the same error about repeated alternatives unless the problematic observations are dropped or excluded using an if restriction.)

```
. cmset consumerid car, force
note: at least one choice set has more than one instance of the same
    alternative.
    Case ID variable: consumerid
Alternatives variable: car
```

Now we can run cmsample. We specify the option generate(flag) to create a variable named flag that identifies the problem observations.

. cmsample, generate(flag)

Reason for exclusion	Freq.	Percent	Cum.
observations included repeated alternatives within case*	3,153 7	99.78 0.22	99.78 100.00
Total	3,160	100.00	

* indicates an error

cmsample produced a table that showed there are seven observations that contain the cases with the repeated alternatives. We can see the problems by listing the observations with flag != 0:

. list consumerid car flag if flag != 0, sepby(consumerid) abbr(10)

	consumerid	car	flag
397.	111	American	repeated alternatives within case* repeated alternatives within case* repeated alternatives within case*
398.	111	Japanese	
399.	111	Japanese	
1035.	290	American	repeated alternatives within case* repeated alternatives within case* repeated alternatives within case* repeated alternatives within case*
1036.	290	Japanese	
1037.	290	Japanese	
1038.	290	Korean	

We will need to fix or drop these cases before we can run other CM commands.

cmsample can identify many different problems in your choice data—16 different problems in all! To see its full capabilities, see [CM] cmsample.

cmtab: Tabulating chosen alternatives versus other variables

Let's reload our earlier dataset so we are not dealing with a dataset with cm errors.

```
. use \label{lem:https://www.stata-press.com/data/r18/carchoice, clear} \mbox{(Car choice data)}
```

. cmset consumerid car

note: alternatives are unbalanced across choice sets; choice sets of different sizes found.

Case ID variable: consumerid Alternatives variable: car

The cmtab command requires the choice(varname) option, where varname is a 0/1 variable indicating which alternative was chosen. Typically, it is the dependent variable used in a discrete choice model. Typing cmtab without any other arguments gives a tabulation of the chosen alternatives:

. cmtab, choice(purchase)

Tabulation of chosen alternatives (purchase = 1)

Nationality of car	Freq.	Percent	Cum.
American	384	43.39	43.39
Japanese	326	36.84	80.23
European	135	15.25	95.48
Korean	40	4.52	100.00
Total	885	100.00	

Typing cmtab with a variable gives a tabulation of that variable versus the chosen alternatives.

. cmtab gender, choice(purchase) column

Tabulation for chosen alternatives (purchase = 1)

gender is constant within case

Key
frequency column percentage

Nationalit	Gender: 0 = Ma	•	
y of car	Female	Male	Total
American	96	280	376
	40.68	44.73	43.62
Japanese	110	206	316
	46.61	32.91	36.66
European	22	108	130
	9.32	17.25	15.08
Korean	8	32	40
	3.39	5.11	4.64
Total	236	626	862
	100.00	100.00	100.00

We see that in these data, the most popular nationality of car among females was Japanese, with 47% of them purchasing a Japanese car. Among males, American cars were the most popular, with 45% of them buying an American car.

See [CM] cmtab for the full capabilities of the command.

cmsummarize: Descriptive statistics for CM variables

The cmsummarize command produces descriptive statistics for CM variables. For each variable in the command's *varlist*, it selects observations that correspond to chosen alternatives and displays statistics categorized by the chosen alternatives. The chosen alternatives are specified by the choice(*varname*) option, which is required, just as it is with cmtab.

Here is an example where we display the quartiles of the case-specific variable income:

. cmsummarize income, choice(purchase) stats(p25 p50 p75) format(%5.1f)

Statistics by chosen alternatives (purchase = 1)

income is constant within case

Summary for variables: income

Group variable: _chosen_alternative (purchase = 1)

_chosen_alternative	p25	p50	p75
American	30.6	42.0	46.6
Japanese	39.0	44.4	48.8
European	40.5	44.6	49.2
Korean	25.4	35.5	44.2
Total	33.0	43.3	46.7

We see that buyers of European cars have the greatest median income and buyers of Korean cars the least compared with buyers of cars of other nationalities.

See [CM] cmsummarize for the full capabilities of the command.
