Title

> **lassocoef —** Display coefficients after lasso estimation results

Description

lassocoef displays a table showing the selected variables after one or more lasso estimation results. It can also display the values of the coefficient estimates. When used with stored results from two or more lassos, it can be used to view the overlap between sets of selected variables.

After ds, po, and xpo commands, and after telasso, lassocoef can be used to view coefficients for a single lasso or for multiple lassos displayed side by side.

Quick start

Display the selected variables after lasso, sqrtlasso, or elasticnet

    lassocoef

Display the values of the postselection coefficients after lasso, sqrtlasso, or elasticnet

    lassocoef, display(coef, postselection)

Display the penalized coefficients of the standardized variables after lasso, sqrtlasso, or elasticnet sorted by their absolute values in descending order

    lassocoef, display(coef, standardized) sort(coef, standardized)

Compare which variables were selected from three different runs of lasso, where the estimation results are stored under the names mylasso1, mylasso2, and mylasso3

    lassocoef mylasso1 mylasso2 mylasso3

Same as above, but display the penalized coefficients of the unstandardized variables sorted by the values of the penalized coefficients of the standardized variables

    lassocoef mylasso1 mylasso2 mylasso3, display(coef, penalized) ///
        sort(coef, standardized)

After fitting a lasso logit model, display the exponentiated postselection coefficients, which are odds ratios, and specify their display format

    lassocoef, display(coef, postselection eform format(%6.2f))

After any of the ds or po commands, display the selected variables in the lasso for the dependent variable y

    lassocoef (., for(y))

Same as above, but display the penalized coefficients of the standardized variables in the lasso for y sorted by their absolute values

    lassocoef (., for(y)), display(coef, standardized) ///
        sort(coef, standardized)

1

Same as above, but compare the lasso for y from the results stored in mydsregress with the lasso for y from the results stored in myporegress

```
lassocoef (mydsregress, for(y)) (myporegress, for(y)), ///
     display(coef, standardized) sort(coef, standardized)
```

After xpologit without resample, compare the variables selected by the lassos for x in each of the 10 cross-fit folds

```
lassocoef (myxpo, for(x) xfold(1)) ///
          (myxpo, for(x) xfold(2)) ///
            .
            .
            .
          (myxpo, for(x) xfold(10))
```

After xpologit with resample, compare the variables selected by the lassos for x in each of the 10 cross-fit folds in the first resample

```
lassocoef (myxpo, for(x) xfold(1) resample(1)) ///
          (myxpo, for(x) xfold(2) resample(1)) ///
            .
            .
            .
          (myxpo, for(x) xfold(10) resample(1))
```

After telasso, display the selected variables in the lasso for the outcome variable y at treatment levels 1 and 0

```
lassocoef (., for(y) tlevel(1)) (., for(y) tlevel(0))
```

Menu

Statistics > Postestimation

Syntax

For current estimation results

   After lasso, sqrtlasso, *or* elasticnet

   lassocoef [, *options*]

   After ds *or* po

   lassocoef (., for(*varspec*)) [, *options*]

   After xpo *without* resample

   lassocoef (., for(*varspec*) xfold(#)) [, *options*]

   After xpo *with* resample

   lassocoef (., for(*varspec*) xfold(#) resample(#)) [, *options*]

   After telasso *for the outcome variable*

   lassocoef (., for(*varspec*) tlevel(#)) [, *options*]

   After telasso *for the treatment variable*

   lassocoef (., for(*varspec*)) [, *options*]

   After telasso *for the outcome variable with cross-fitting but without* resample

   lassocoef (., for(*varspec*) tlevel(#) xfold(#)) [, *options*]

   After telasso *for the treatment variable with cross-fitting but without* resample

   lassocoef (., for(*varspec*) xfold(#)) [, *options*]

   After telasso *for the outcome variable with cross-fitting and* resample

   lassocoef (., for(*varspec*) tlevel(#) xfold(#) resample(#)) [, *options*]

   After telasso *for the treatment variable with cross-fitting and* resample

   lassocoef (., for(*varspec*) xfold(#) resample(#)) [, *options*]

For multiple stored estimation results

   lassocoef [*estspec1* [*estspec2 . . .*]] [, *options*]

estspec for lasso, sqrtlasso, and elasticnet is

  name

estspec for ds and po models is

  (*name*, for(*varspec*))

estspec for xpo without resample is

  (*name*, for(*varspec*) xfold(*#*))

estspec for xpo with resample is

  (*name*, for(*varspec*) xfold(*#*) resample(*#*))

estspec for the treatment model in telasso is

  (*name*, for(*varspec*))

estspec for the outcome model at the treatment level *#* in telasso is

  (*name*, for(*varspec*) tlevel(*#*))

estspec for the treatment model in telasso with cross-fitting but without resample is

  (*name*, for(*varspec*) xfold(*#*))

estspec for the outcome model at the treatment level *#* in telasso with cross-fitting but without resample is

  (*name*, for(*varspec*) tlevel(*#*) xfold(*#*))

estspec for the treatment model in telasso with resample is

  (*name*, for(*varspec*) xfold(*#*) resample(*#*))

estspec for the outcome model at the treatment level *#* in telasso with resample is

  (*name*, for(*varspec*) tlevel(*#*) xfold(*#*) resample(*#*))

name is the name of a stored estimation result. Either nothing or a period (.) can be used to specify the current estimation result. _all or * can be used to specify all stored estimation results when all stored results are lasso, sqrtlasso, or elasticnet.

varspec is *varname*, except after poivregress and xpoivregress, when it is either *varname* or pred(*varname*).

options	Description
Options	
<u>di</u>splay(x)	indicate selected variables with an x; the default
<u>di</u>splay(u)	same as display(x), except variables unavailable to be selected indicated with a u
<u>di</u>splay(coef [, *coef_di_opts*])	display coefficient values
<u>sort</u>(none)	order of variables as originally specified; the default
<u>sort</u>(names)	order by the names of the variables
<u>sort</u>(coef [, *coef_sort_opts*])	order by the absolute values of the coefficients in descending order
<u>nofv</u>label	display factor-variable level values rather than value labels
<u>nol</u>egend	report or suppress table legend
<u>nolstr</u>etch	do not stretch the width of the table to accommodate long variable names

collect is allowed; see [U] **11.1.10 Prefix commands**.

nofvlabel, nolegend, and nolstretch do not appear in the dialog box.

coef_di_opts	Description
<u>s</u>tandardized	display penalized coefficients of standardized variables; the default
<u>pen</u>alized	display penalized coefficients of unstandardized variables
<u>pos</u>tselection	display postselection coefficients of unstandardized variables
<u>ef</u>orm	display $\exp(b)$ rather than the coefficient b
<u>f</u>ormat(% *fmt*)	use numerical format % *fmt* for the coefficient values

coef_sort_opts	Description
<u>s</u>tandardized	sort by penalized coefficients of standardized variables
<u>pen</u>alized	sort by penalized coefficients of unstandardized variables
<u>pos</u>tselection	sort by postselection coefficients of unstandardized variables

Options

> **Options**

display(*displayspec*) specifies what to display in the table. The default is display(x).

Blank cells in the table indicate that the corresponding variable was not selected by the lasso or was not specified in the model.

For some variables without fitted values, a code that indicates the reason for omission is reported in the table.

Empty levels of factors and interactions are coded with the letter e.

Base levels of factors and interactions are coded with the letter b. Base levels can be set on *alwaysvars* (variables always included in the lasso) but not on *othervars* (the set of variables from which lasso selects).

Variables omitted because of collinearity are coded with the letter o. Lasso does not label as omitted any *othervars* because of collinearity. Collinear variables are simply not selected. Variables in *alwaysvars* can be omitted because of collinearity. See *Remarks and examples* in [LASSO] **Collinear covariates**.

display(x) displays an x in the table when the variable has been selected by the lasso; that is, it has a nonzero coefficient.

display(u) is the same as display(x), except that when a variable was not specified in the model, u (for unavailable) is displayed instead of a blank cell.

display(coef [, standardized penalized postselection eform format(%*fmt*)])
    specifies that coefficient values be displayed in the table.

   standardized specifies that the penalized coefficients of the standardized variables be dis-
       played. This is the default when display(coef) is specified without options. Penalized
       coefficients of the standardized variables are the coefficient values used in the estimation of
       the lasso penalty. See *Methods and formulas* in [LASSO] **lasso**.

   penalized specifies that the penalized coefficients of the unstandardized variables be displayed.
       Penalized coefficients of the unstandardized variables are the penalized coefficients of the
       standardized variables with the standardization removed.

   postselection specifies that the postselection coefficients of the unstandardized variables be
       displayed. Postselection coefficients of the unstandardized variables are obtained by fitting an
       ordinary model (regress for lasso linear, logit for lasso logit, probit for lasso
       probit, and poisson for lasso poisson) using the selected variables. See *Methods and
       formulas* in [LASSO] **lasso**.

   eform displays coefficients in exponentiated form. For each coefficient, $\exp(b)$ rather than b
       is displayed. This option can be used to display odds ratios or incidence-rate ratios after the
       appropriate estimation command.

   format(%*fmt*) specifies the display format for the coefficients in the table. The default is
       format(%9.0g).

sort(*sortspec*) specifies that the rows of the table be ordered by specification given by *sortspec*.

   sort(none) specifies that the rows of the table be ordered by the order the variables were specified
       in the model specification. This is the default.

   sort(names) orders rows alphabetically by the variable names of the covariates. In the case
       of factor variables, main effects and nonfactor variables are displayed first in alphabetical
       order. Then, all two-way interactions are displayed in alphabetical order, then, all three-way
       interactions, and so on.

   sort(coef [, standardized penalized postselection]) orders rows in descending order
       by the absolute values of the coefficients. When results from two or more estimation results
       are displayed, results are sorted first by the ordering for the first estimation result with rows
       representing coefficients not in the first estimation result last. Within the rows representing
       coefficients not in the first estimation result, the rows are sorted by the ordering for the second
       estimation result with rows representing coefficients not in the first or second estimation results
       last. And so on.

      standardized orders rows in descending order by the absolute values of the penalized
          coefficients of the standardized variables. This is the default when sort(coef) is specified
          without options.

penalized orders rows in descending order by the absolute values of the penalized coefficients of the unstandardized variables.

postselection orders rows in descending order by the absolute values of the postselection coefficients of the unstandardized variables.

nofvlabel displays factor-variable level numerical values rather than attached value labels. This option overrides the fvlabel setting. See [R] **set showbaselevels**.

nolegend specifies that the legend at the bottom of the table not be displayed. By default, it is shown.

nolstretch specifies that the width of the table not be automatically widened to accommodate long variable names. When nolstretch is specified, names are abbreviated to make the table width no more than 79 characters. The default, lstretch, is to automatically widen the table up to the width of the Results window. To change the default, use set lstretch off.

Required options for *estspec* after telasso, ds, po, and xpo:

for(*varspec*) specifies a particular lasso after telasso or after a ds, po, or xpo estimation command fit using the option selection(cv), selection(adaptive), or selection(bic). For all commands except poivregress and xpoivregress, *varspec* is always *varname*.

For the ds, po, and xpo commands except poivregress and xpoivregress, *varspec* is either *depvar*, the dependent variable, or one of *varsofinterest* for which inference is done.

For poivregress and xpoivregress, *varspec* is either *varname* or pred(*varname*). The lasso for *depvar* is specified with its *varname*. Each of the endogenous variables have two lassos, specified by *varname* and pred(*varname*). The exogenous variables of interest each have only one lasso, and it is specified by pred(*varname*).

For telasso, *varspec* is either the outcome variable or the treatment variable.

This option is required after telasso and after the ds, po, and xpo commands.

xfold(#) specifies a particular lasso after an xpo estimation command or after telasso when the option xfolds(#) was specified. For each variable to be fit with a lasso, K lassos are done, one for each cross-fit fold, where K is the number of folds. This option specifies which fold, where $\# = 1, 2, \ldots, K$. xfold(#) is required after an xpo command and after telasso when the option xfolds(#) was specified.

resample(#) specifies a particular lasso after an xpo estimation command or after telasso fit using the option resample(#). For each variable to be fit with a lasso, $R \times K$ lassos are done, where R is the number of resamples and K is the number of cross-fitting folds. This option specifies which resample, where $\# = 1, 2, \ldots, R$. resample(#), along with xfold(#), is required after an xpo command and after telasso with resampling.

tlevel(#) specifies the lasso for the outcome variable at the specified treatment level after telasso. This option is required to refer to the outcome model after telasso.

Remarks and examples

lassocoef lists the variables selected by a lasso and optionally lists the values of their coefficients. It is useful for comparing the results of multiple lassos. It shows how much overlap there is among the sets of selected variables from the lassos.

By default, lassocoef indicates only whether a variable was selected, marking a selected variable with an x. The option display(coef, *coef_type*) can be used to display the values of the coefficients.

Lassos store three different types of coefficients (*coef_types*). We refer to them as `standardized`, `penalized`, and `postselection`.

Before a lasso is fit, the potential variables in the model are standardized so that they each have mean 0 and standard deviation 1. `standardized` refers to the coefficients of the standardized variables exactly as estimated by the minimization of the objective function.

`penalized` refers to the coefficients from the minimization of the objective function with the standardization unwound. `standardized`, strictly speaking, gives the penalized coefficients of the standardized variables. `penalized` gives the penalized coefficients of the unstandardized variables.

`postselection` coefficients are computed by taking the selected variables and, for a linear lasso, estimating an ordinary least-squares linear regression with them, and using those coefficients. For a logit lasso, a logistic regression gives the postselection coefficients; for a probit lasso, a probit regression gives them; and for a Poisson lasso, a Poisson regression gives them.

`lassocoef` also has a `sort(coef, `*coef_type*`)` option, which controls the order in which the variables are listed. The most useful ordering is `sort(coef, standardized)`. It sorts the listing by the absolute values of the standardized coefficients with the largest displayed first. Variables with larger absolute values of their standardized coefficients take up a larger share of the lasso penalty, and so in this sense, they are "more important" for prediction than variables with smaller values.

▷ Example 1: lasso

We will show some uses of `lassocoef` after `lasso`.

Here is an example using `lasso` from [LASSO] **lasso examples**. We load the data and make the `vl` variable lists active.

```
. use https://www.stata-press.com/data/r18/fakesurvey_vl
(Fictitious survey data with vl)
. vl rebuild
Rebuilding vl macros ...
  (output omitted )
```

We fit the lasso.

```
. lasso linear q104 $idemographics $ifactors $vlcontinuous, rseed(1234)
10-fold cross-validation with 100 lambdas ...
Grid value 1:       lambda = .9090511   no. of nonzero coef. =   0
Folds: 1...5....10   CVF = 18.33331
  (output omitted )
Grid value 28:     lambda = .0737359   no. of nonzero coef. =  80
Folds: 1...5....10   CVF = 11.92887
... cross-validation complete ... minimum found
Lasso linear model                         No. of obs        =        914
                                           No. of covariates =        277
Selection: Cross-validation                No. of CV folds   =         10
```

ID	Description	lambda	No. of nonzero coef.	Out-of-sample R-squared	CV mean prediction error
1	first lambda	.9090511	0	-0.0010	18.33331
23	lambda before	.1174085	58	0.3543	11.82553
* 24	selected lambda	.1069782	64	0.3547	11.81814
25	lambda after	.0974746	66	0.3545	11.8222
28	last lambda	.0737359	80	0.3487	11.92887

* lambda selected by cross-validation.

By default, after only one lasso, `lassocoef` lists the variables selected by the lasso.

```
. lassocoef
```

	active
0.gender	x
0.q3	x
0.q4	x
0.q5	x
2.q6	x
0.q7	x
(output omitted)	
q111	x
q139	x
_cons	x

```
Legend:
  b - base level
  e - empty cell
  o - omitted
  x - estimated
```

`lassocoef` is intended to be used to compare multiple lassos. So let's store the results of this lasso before we fit another. See [LASSO] **estimates store** for more on storing and saving lasso results.

```
. estimates store lassocv
```

We fit an adaptive lasso.

```
. lasso linear q104 $idemographics $ifactors $vlcontinuous,
> selection(adaptive) rseed(1234)
```

(output omitted)

```
Lasso linear model                      No. of obs        =      914
                                        No. of covariates =      277
Selection: Adaptive                     No. of lasso steps =       2
Final adaptive step results
```

ID	Description	lambda	No. of nonzero coef.	Out-of-sample R-squared	CV mean prediction error
29	first lambda	52.54847	0	-0.0011	18.3349
82	lambda before	.3794425	40	0.4077	10.84767
* 83	selected lambda	.3457338	41	0.4077	10.84764
84	lambda after	.3150198	42	0.4074	10.85301
128	last lambda	.0052548	62	0.3954	11.07398

```
* lambda selected by cross-validation in final adaptive step.

. estimates store lassoadaptive
```

Adaptive lasso selected 41 variables. Lasso selected 64. We can compare both the differences in selection and differences in the values of the coefficients. We use `lassocoef` with `display(coef, standardized)` to list the values of the standardized coefficients. We specify `sort(coef, standardized)` to sort them so that the largest ones in absolute value from the first lasso are shown first. The option `nofvlabel` means that numerical values for the factor-variable levels are displayed rather than value labels.

```
. lassocoef lassocv lassoadaptive, display(coef, standardized)
> sort(coef, standardized) nofvlabel nolegend
```

	lassocv	lassoadaptive
0.q19	-.8228234	-.9542076
0.q88	.7464342	.8650972
3.q156	-.6770033	-.770628
0.q48	-.6055556	-.7086328
0.q73	-.5962807	-.7036719
0.q85	-.5855315	-.684066
q31	.5843145	.7228376
0.q101	.5565875	.6682665

(output omitted)

	lassocv	
0.q75	-.0056084	
q63	-.0055279	
0.q55	-.0054106	
0.q51	.0043129	
0.q77	.0019468	
0.q115	.0005097	
_cons	3.55e-15	0

Most of the differences occur in the coefficients with the smallest absolute values.

Let's fit another lasso. Note that we omitted the variable list `idemographics` from the potential variables this time.

```
. lasso linear q104 $ifactors $vlcontinuous, selection(cv) rseed(1234)
```

(output omitted)

```
Lasso linear model                      No. of obs        =        916
                                        No. of covariates =        269
Selection: Cross-validation             No. of CV folds   =         10
```

ID	Description	lambda	No. of nonzero coef.	Out-of- sample R-squared	CV mean prediction error
1	first lambda	.9127278	0	-0.0020	18.33925
24	lambda before	.1074109	57	0.3406	12.06842
* 25	selected lambda	.0978688	62	0.3407	12.06704
26	lambda after	.0891744	70	0.3400	12.07962
28	last lambda	.0740342	78	0.3361	12.15082

```
* lambda selected by cross-validation.

. estimates store lassocv2
```

The option display(u) puts a u next to the variables that were unavailable to be selected.

```
. lassocoef lassocv lassocv2, display(u)
```

	lassocv	lassocv2
0.gender	x	u
0.q3	x	u
0.q4	x	u
0.q5	x	u
q6		
2	x	x
3		x
(*output omitted*)		
q100		
No		x
q21		x
q52		x
_cons	x	x

```
Legend:
  b - base level
  e - empty cell
  o - omitted
  x - estimated
  u - not selected for estimation
```

If display(u) was not specified, there would be empty space in place of the u's. So this option is useful for distinguishing whether a variable was not selected or simply not included in the model specification.

◁

▷ Example 2: poivregress

We want to show you some differences that arise when you fit models containing endogenous variables using poivregress and xpoivregress.

We will not describe the data or the model here. See [LASSO] **Inference examples**.

We load the data,

```
. use https://www.stata-press.com/data/r18/mroz2, clear
```

set vl variable lists,

```
. vl create vars    = (kidslt6 kidsge6 age husage city exper)
note: $vars initialized with 6 variables.
. vl substitute vars2 = c.vars c.vars#c.vars
. vl create iv      = (huseduc motheduc fatheduc)
note: $iv initialized with 3 variables.
. vl substitute iv2   = c.iv c.iv#c.iv
```

and fit our model using `poivregress`.

```
. poivregress lwage (educ = $iv2), controls($vars2) selection(cv) rseed(12345)
Estimating lasso for lwage using cv
Estimating lasso for educ using cv
Estimating lasso for pred(educ) using cv
```

```
Partialing-out IV linear model       Number of obs           =         428
                                     Number of controls      =          27
                                     Number of instruments   =           9
                                     Number of selected controls =        16
                                     Number of selected instruments =       4
                                     Wald chi2(1)            =       11.10
                                     Prob > chi2             =      0.0009
```

lwage	Coefficient	Robust std. err.	z	P>|z|	[95% conf. interval]
educ	.0765154	.0229707	3.33	0.001	.0314936	.1215371

Endogenous: educ
Note: Chi-squared test is a Wald test of the coefficients of the variables
of interest jointly equal to zero. Lassos select controls for model
estimation. Type lassoinfo to see number of selected variables in each
lasso.

```
. estimates store poivregresscv
```

We use [lassoinfo](#) to see the lassos fit by `poivregress`.

```
. lassoinfo poivregresscv
   Estimate: poivregresscv
    Command: poivregress
```

Variable	Model	Selection method	Selection criterion	lambda	No. of selected variables
lwage	linear	cv	CV min.	.0353704	3
educ	linear	cv	CV min.	.0530428	10
pred(educ)	linear	cv	CV min.	.013186	12

We have two lassos for educ, the endogenous variable in the model. One is named educ and the other pred(educ). To compare the coefficient estimates for these two lassos, we type

```
. lassocoef (poivregresscv, for(educ)) (poivregresscv, for(pred(educ))),
> display(coef, standardized) sort(coef, standardized) nolegend
```

	poivregresscv educ	poivregresscv pred(educ)

▷ Example 3: xporegress

The xpo commands fit many lassos. For each lasso fit by a po command, the corresponding xpo command fits xfolds(#) × resample(#) lassos. Cross-fitting randomly creates different divisions of the data for each resample. We expect that lasso will select different variables for different cross-fit folds and resamples. See [LASSO] **Inference examples** for a description of the data and model.

We load the data, set vl variable lists, fit our model using xporegress with the options xfolds(3) and resample(2), and then store the results with estimates store.

```
. use https://www.stata-press.com/data/r18/breathe, clear
(Nitrogen dioxide and attention)
```

```
. vl set
  (output omitted)
. vl move (siblings_old siblings_young) vlcontinuous
note: 2 variables specified and 2 variables moved.
  (output omitted)
. vl create mycontinuous   = vlcontinuous - (react no2_class)
note: $mycontinuous initialized with 10 variables.
. vl substitute mycontrols = i.vlcategorical mycontinuous
. xporegress react no2_class, controls($mycontrols) xfolds(3) resample(2)
> selection(cv) rseed(12345)

react	Coefficient	Robust std. err.	z	P>|z|	[95% conf. interval]
no2_class	2.332193	.5090902	4.58	0.000	1.334394 3.329991

```
Note: Chi-squared test is a Wald test of the coefficients of the variables
      of interest jointly equal to zero. Lassos select controls for model
      estimation. Type lassoinfo to see number of selected variables in each
      lasso.
. estimates store xpocv
```

For each cross-fit fold and each resample, **xporegress** fits lassos. It fit six lassos for the dependent variable, **react**, and six for the variable of interest, **no2_class**. To see how the variables selected differ for different folds and for different resamples, we type

```
. lassocoef (xpocv, for(react) resample(1) xfold(1))
>           (xpocv, for(react) resample(1) xfold(2))
>           (xpocv, for(react) resample(1) xfold(3))
>           (xpocv, for(react) resample(2) xfold(1))
>           (xpocv, for(react) resample(2) xfold(2))
>           (xpocv, for(react) resample(2) xfold(3))
>           , sort(coef, standardized)
```

Legend:
  b - base level
  e - empty cell
  o - omitted
  x - estimated

Even though we had lassocoef display x's, we specified the sort(coef, standardized) option so that the table is ordered by the most important variables from the lasso in the first column.

◁

Stored results

lassocoef stores the following in r():

Macros
    r(names)   names of results used

Matrices
    r(coef)   matrix M: $n \times m$
                      $M[i, j] = i$th coefficient estimate for model j; $i=1,...,n$; $j=1,...,m$
