

**strreverse()** — Reverse string

[Description](#)  
[Diagnostics](#)

[Syntax](#)  
[Also see](#)

[Remarks and examples](#)

[Conformability](#)

## Description

`strreverse(s)` reverses the ASCII string *s*.

When *s* is not a scalar, `strreverse()` returns element-by-element results.

## Syntax

*string matrix* `strreverse(string matrix s)`

## Remarks and examples

[stata.com](#)

`strreverse()` is intended for use with ASCII characters. For Unicode characters beyond the ASCII range, the encoded bytes are reversed.

Use `ustrreverse()` to return a string with its Unicode characters in reverse order.

## Conformability

`strreverse(s)`

*s*:  $r \times c$   
*result*:  $r \times c$

## Diagnostics

None.
