corrgram — Tabulate and graph autocorrelations

Description

`corrgram` produces a table of the autocorrelations, partial autocorrelations, and portmanteau (Q) statistics. It also displays a character-based plot of the autocorrelations and partial autocorrelations. See [TS] **wntestq** for more information on the Q statistic.

`ac` produces a correlogram (a graph of autocorrelations) with pointwise confidence intervals that is based on Bartlett's formula for MA(q) processes.

`pac` produces a partial correlogram (a graph of partial autocorrelations) with confidence intervals calculated using a standard error of $1/\sqrt{n}$. The residual variances for each lag may optionally be included on the graph.

Quick start

Produce correlogram for `y` using `tsset` data

```
corrgram y
```

As above, but limit the number of computed autocorrelations to 10

```
corrgram y, lags(10)
```

Plot the autocorrelation function for `y`

```
ac y
```

As above, and generate `newv` to hold the autocorrelations

```
ac y, generate(newv)
```

Plot partial autocorrelation function for `y` and include standardized residual variances in the graph

```
pac y, srv
```

Menu

corrgram

Statistics > Time series > Graphs > Autocorrelations & partial autocorrelations

ac

Statistics > Time series > Graphs > Correlogram (ac)

pac

Statistics > Time series > Graphs > Partial correlogram (pac)

Syntax

Autocorrelations, partial autocorrelations, and portmanteau (Q) statistics

corrgram *varname* [*if*] [*in*] [, *corrgram_options*]

Graph autocorrelations with confidence intervals

ac *varname* [*if*] [*in*] [, *ac_options*]

Graph partial autocorrelations with confidence intervals

pac *varname* [*if*] [*in*] [, *pac_options*]

corrgram_options	Description
Main	
lags(#)	calculate # autocorrelations
noplot	suppress character-based plots
yw	calculate partial autocorrelations by using Yule–Walker equations

ac_options	Description
Main	
lags(#)	calculate # autocorrelations
generate(*newvar*)	generate a variable to hold the autocorrelations
level(#)	set confidence level; default is level(95)
fft	calculate autocorrelation by using Fourier transforms
Plot	
line_options	change look of dropped lines
marker_options	change look of markers (color, size, etc.)
marker_label_options	add marker labels; change look or position
CI plot	
ciopts(*area_options*)	affect rendition of the confidence bands
Add plots	
addplot(*plot*)	add other plots to the generated graph
Y axis, X axis, Titles, Legend, Overall	
twoway_options	any options other than by() documented in [G-3] ***twoway_options***

pac_options	Description
Main	
lags(#)	calculate # partial autocorrelations
generate(*newvar*)	generate a variable to hold the partial autocorrelations
yw	calculate partial autocorrelations by using Yule–Walker equations
level(#)	set confidence level; default is level(95)
Plot	
line_options	change look of dropped lines
marker_options	change look of markers (color, size, etc.)
marker_label_options	add marker labels; change look or position
CI plot	
ciopts(*area_options*)	affect rendition of the confidence bands
SRV plot	
srv	include standardized residual variances in graph
srvopts(*marker_options*)	affect rendition of the plotted standardized residual variances (SRVs)
Add plots	
addplot(*plot*)	add other plots to the generated graph
Y axis, X axis, Titles, Legend, Overall	
twoway_options	any options other than by() documented in [G-3] ***twoway_options***

You must tsset your data before using corrgram, ac, or pac; see [TS] **tsset**. Also, the time series must be dense (nonmissing and no gaps in the time variable) in the sample if you specify the fft option.

varname may contain time-series operators; see [U] **11.4.4 Time-series varlists**.

Options for corrgram

Main

lags(#) specifies the number of autocorrelations to calculate. The default is to use $\min(\lfloor n/2 \rfloor - 2, 40)$, where $\lfloor n/2 \rfloor$ is the greatest integer less than or equal to $n/2$.

noplot prevents the character-based plots from being in the listed table of autocorrelations and partial autocorrelations.

yw specifies that the partial autocorrelations be calculated using the Yule–Walker equations instead of using the default regression-based technique. yw cannot be used if srv is used.

Options for ac and pac

Main

lags(#) specifies the number of autocorrelations to calculate. The default is to use $\min(\lfloor n/2 \rfloor - 2, 40)$, where $\lfloor n/2 \rfloor$ is the greatest integer less than or equal to $n/2$.

generate(*newvar*) specifies a new variable to contain the autocorrelation (ac command) or partial autocorrelation (pac command) values. This option is required if the nograph option is used.

nograph (implied when using generate() in the dialog box) prevents ac and pac from constructing a graph. This option requires the generate() option.

yw (pac only) specifies that the partial autocorrelations be calculated using the Yule–Walker equations instead of using the default regression-based technique. yw cannot be used if srv is used.

level(#) specifies the confidence level, as a percentage, for the confidence bands in the ac or pac graph. The default is level(95) or as set by set level; see [R] **level**.

fft (ac only) specifies that the autocorrelations be calculated using two Fourier transforms. This technique can be faster than simply iterating over the requested number of lags.

Plot

line_options, *marker_options*, and *marker_label_options* affect the rendition of the plotted autocorrelations (with ac) or partial autocorrelations (with pac).

line_options specify the look of the dropped lines, including pattern, width, and color; see [G-3] ***line_options***.

marker_options specify the look of markers. This look includes the marker symbol, the marker size, and its color and outline; see [G-3] ***marker_options***.

marker_label_options specify if and how the markers are to be labeled; see [G-3] ***marker_label_options***.

CI plot

ciopts(*area_options*) affects the rendition of the confidence bands; see [G-3] ***area_options***.

SRV plot

srv (pac only) specifies that the standardized residual variances be plotted with the partial autocorrelations. srv cannot be used if yw is used.

srvopts(*marker_options*) (pac only) affects the rendition of the plotted standardized residual variances; see [G-3] ***marker_options***. This option implies the srv option.

Add plots

addplot(*plot*) adds specified plots to the generated graph; see [G-3] ***addplot_option***.

Y axis, X axis, Titles, Legend, Overall

twoway_options are any of the options documented in [G-3] ***twoway_options***, excluding by(). These include options for titling the graph (see [G-3] ***title_options***) and for saving the graph to disk (see [G-3] ***saving_option***).

Remarks and examples

Remarks are presented under the following headings:

Basic examples

`corrgram` tabulates autocorrelations, partial autocorrelations, and portmanteau (Q) statistics and plots the autocorrelations and partial autocorrelations. The Q statistics are the same as those produced by [TS] **wntestq**. `ac` produces graphs of the autocorrelations, and `pac` produces graphs of the partial autocorrelations. See Becketti (2013) for additional examples of how these commands are used in practice.

▷ Example 1

Here we use the international airline passengers dataset (Box, Jenkins, and Reinsel 2008, Series G). This dataset has 144 observations on the monthly number of international airline passengers from 1949 through 1960. We can list the autocorrelations and partial autocorrelations by using `corrgram`.

```
. use http://www.stata-press.com/data/r15/air2
(TIMESLAB: Airline passengers)

. corrgram air, lags(20)

                                          -1       0       1 -1       0       1
 LAG       AC       PAC      Q     Prob>Q  [Autocorrelation]  [Partial Autocor]
-------------------------------------------------------------------------------
1        0.9480   0.9589   132.14  0.0000          |-------           |-------
2        0.8756  -0.3298   245.65  0.0000          |-------         --|
3        0.8067   0.2018   342.67  0.0000          |------            |-
4        0.7526   0.1450   427.74  0.0000          |------            |-
5        0.7138   0.2585    504.8  0.0000          |-----             |--
6        0.6817  -0.0269    575.6  0.0000          |-----             |

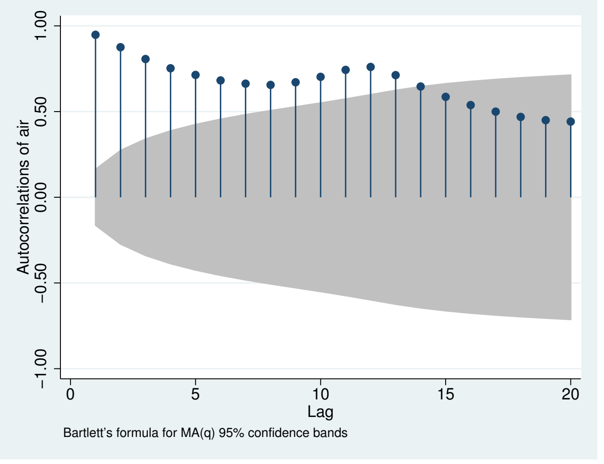
11       0.7432   0.8402   944.39  0.0000          |-----             |------
12       0.7604   0.6127   1036.5  0.0000          |------            |----
13       0.7127  -0.6660     1118  0.0000          |-----        -----|
14       0.6463  -0.3846   1185.6  0.0000          |-----          ---|
15       0.5859   0.0787   1241.5  0.0000          |----              |
16       0.5380  -0.0266     1289  0.0000          |----              |
17       0.4997  -0.0581   1330.4  0.0000          |---               |
18       0.4687  -0.0435     1367  0.0000          |---               |
19       0.4499   0.2773   1401.1  0.0000          |---               |--
20       0.4416  -0.0405   1434.1  0.0000          |---               |
```

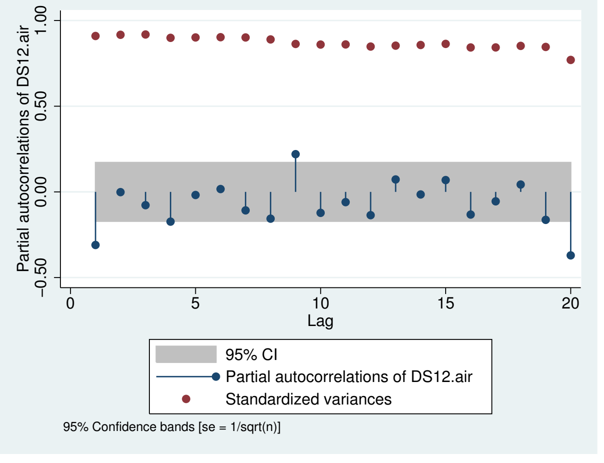
We can use ac to produce a graph of the autocorrelations.

```
. ac air, lags(20)
```



The data probably have a trend component as well as a seasonal component. First-differencing will mitigate the effects of the trend, and seasonal differencing will help control for seasonality. To accomplish this goal, we can use Stata's time-series operators. Here we graph the partial autocorrelations after controlling for trends and seasonality. We also use srv to include the standardized residual variances.

```
. pac DS12.air, lags(20) srv
```



See [U] 11.4.4 Time-series varlists for more information about time-series operators.

Video example

Correlograms and partial correlograms

Stored results

`corrgram` stores the following in `r()`:

Scalars

`r(lags)`	number of lags
`r(ac#)`	AC for lag #
`r(pac#)`	PAC for lag #
`r(q#)`	Q for lag #

Matrices

`r(AC)`	vector of autocorrelations
`r(PAC)`	vector of partial autocorrelations
`r(Q)`	vector of Q statistics

Methods and formulas

Box, Jenkins, and Reinsel (2008, sec. 2.1.4); Newton (1988); Chatfield (2004); and Hamilton (1994) provide excellent descriptions of correlograms. Newton (1988) also discusses the calculation of the various quantities.

The autocovariance function for a time series $x_1, x_2, \dots, x_n$ is defined for $|v| < n$ as

$$\widehat{R}(v) = \frac{1}{n} \sum_{i=1}^{n-|v|} (x_i - \overline{x})(x_{i+v} - \overline{x})$$

where $\overline{x}$ is the sample mean, and the autocorrelation function is then defined as

$$\widehat{\rho}_v = \frac{\widehat{R}(v)}{\widehat{R}(0)}$$

The variance of $\widehat{\rho}_v$ is given by Bartlett's formula for MA(q) processes. From Brockwell and Davis (2016, 92), we have

$$\text{Var}(\widehat{\rho}_v) = \begin{cases} 1/n & v = 1 \\ \frac{1}{n}\left\{1 + 2\sum_{i=1}^{v-1} \widehat{\rho}^2(i)\right\} & v > 1 \end{cases}$$

The partial autocorrelation at lag v measures the correlation between x_t and x_{t+v} after the effects of $x_{t+1}, \dots, x_{t+v-1}$ have been removed. By default, `corrgram` and `pac` use a regression-based method to estimate it. We run an OLS regression of x_t on $x_{t-1}, \dots, x_{t-v}$ and a constant term. The estimated coefficient on x_{t-v} is our estimate of the vth partial autocorrelation. The residual variance is the estimated variance of that regression, which we then standardize by dividing by $\widehat{R}(0)$.

If the `yw` option is specified, `corrgram` and `pac` use the Yule–Walker equations to estimate the partial autocorrelations. Per Enders (2010, 66–67), let ϕ_{vv} denote the vth partial autocorrelation coefficient. We then have

$$\widehat{\phi}_{11} = \widehat{\rho}_1$$

and for $v > 1$

$$\widehat{\phi}_{vv} = \frac{\widehat{\rho}_v - \sum_{j=1}^{v-1} \widehat{\phi}_{v-1,j}\widehat{\rho}_{v-j}}{1 - \sum_{j=1}^{v-1} \widehat{\phi}_{v-1,j}\widehat{\rho}_j}$$

and

$$\widehat{\phi}_{vj} = \widehat{\phi}_{v-1,j} - \widehat{\phi}_{vv}\widehat{\phi}_{v-1,v-j} \qquad j = 1, 2, \dots, v-1$$

Unlike the regression-based method, the Yule–Walker equations-based method ensures that the first-sample partial autocorrelation equal the first-sample autocorrelation coefficient, as must be true in the population; see Greene (2008, 725).

McCullough (1998) discusses other methods of estimating ϕ_{vv}; he finds that relative to other methods, such as linear regression, the Yule–Walker equations-based method performs poorly, in part because it is susceptible to numerical error. Box, Jenkins, and Reinsel (2008, 69) also caution against using the Yule–Walker equations-based method, especially with data that are nearly nonstationary.

Acknowledgment

The `ac` and `pac` commands are based on the `ac` and `pac` commands written by Sean Becketti (1992), a past editor of the *Stata Technical Bulletin* and author of the Stata Press book *Introduction to Time Series Using Stata*.
