Syntax

inspect [varlist] [if] [in]

by is allowed; see [D] by.

Menu

Data > Describe data > Inspect variables

Description

The inspect command provides a quick summary of a numeric variable that differs from the summary provided by summarize or tabulate. It reports the number of negative, zero, and positive values; the number of integers and nonintegers; the number of unique values; and the number of missing; and it produces a small histogram. Its purpose is not analytical but is to allow you to quickly gain familiarity with unknown data.

Remarks and examples

Typing inspect by itself produces an inspection for all the variables in the dataset. If you specify a varlist, an inspection of just those variables is presented.

Example 1

inspect is not a replacement or substitute for summarize and tabulate. It is instead a data management or information tool that lets us quickly gain insight into the values stored in a variable.

For instance, we receive data that purport to be on automobiles, and among the variables in the dataset is one called mpg. Its variable label is Mileage (mpg), which is surely suggestive. We inspect the variable,

```
. use http://www.stata-press.com/data/r13/auto
(1978 Automobile Data)
. inspect mpg
```

```
mpg: Mileage (mpg) Number of Observations

          Total   Integers  Nonintegers
# Negative       -       -       -
# Zero           -       -       -
# Positive       74       74       -
# # Total        74       74       -
# # # Missing    -

12     41     74
(21 unique values)
```
and we discover that the variable is never *missing*; all 74 observations in the dataset have some value for mpg. Moreover, the values are all positive and are all integers, as well. Among those 74 observations are 21 unique (different) values. The variable ranges from 12 to 41, and we are provided with a small histogram that suggests that the variable appears to be what it claims.

Example 2

Bob, a coworker, presents us with some census data. Among the variables in the dataset is one called region, which is labeled Census Region and is evidently a numeric variable. We inspect this variable:

```stata
use http://www.stata-press.com/data/r13/bobsdata
.inspect region
.region: Census region

<table>
<thead>
<tr>
<th>#</th>
<th>Negative</th>
<th>Total</th>
<th>Integers</th>
<th>Nonintegers</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>#</td>
<td>Zero</td>
<td></td>
<td>-</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>#</td>
<td>Positive</td>
<td>50</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>#</td>
<td>#</td>
<td>Total</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>#</td>
<td>#</td>
<td>Missing</td>
</tr>
</tbody>
</table>

(5 unique values)

.region is labeled but 1 value is NOT documented in the label.
```

In this dataset something may be wrong. region takes on five unique values. The variable has a value label, however, and one of the observed values is not documented in the label. Perhaps there is a typographical error.

Example 3

There was indeed an error. Bob fixes it and returns the data to us. Here is what `inspect` produces now:

```stata
use http://www.stata-press.com/data/r13/census
.inspect region
.region: Census region

<table>
<thead>
<tr>
<th>#</th>
<th>Negative</th>
<th>Total</th>
<th>Integers</th>
<th>Nonintegers</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>#</td>
<td>Zero</td>
<td></td>
<td>-</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>#</td>
<td>Positive</td>
<td>50</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>#</td>
<td>#</td>
<td>Total</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>#</td>
<td>#</td>
<td>Missing</td>
</tr>
</tbody>
</table>

(4 unique values)

.region is labeled and all values are documented in the label.
```
Example 4

We receive data on the climate in 956 U.S. cities. The variable tempjan records the Average January temperature in degrees Fahrenheit. The results of inspect are

```
use http://www.stata-press.com/data/r13/citytemp
(tempjan: Average January temperature)
.inspect tempjan
```

<table>
<thead>
<tr>
<th>#</th>
<th>Negative</th>
<th>Total</th>
<th>Integers</th>
<th>Nonintegers</th>
</tr>
</thead>
<tbody>
<tr>
<td>#</td>
<td>Zero</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>#</td>
<td>Positive</td>
<td>954</td>
<td>78</td>
<td>876</td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td>Total</td>
<td>954</td>
<td></td>
</tr>
<tr>
<td>#</td>
<td>#</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>.</td>
<td>#</td>
<td>Missing</td>
<td>2</td>
<td></td>
</tr>
</tbody>
</table>

2.2 72.6 956

(More than 99 unique values)

In two of the 956 observations, tempjan is missing. Of the 954 cities that have a recorded tempjan, all are positive, and 78 of them are integer values. tempjan varies between 2.2 and 72.6. There are more than 99 unique values of tempjan in the dataset. (Stata stops counting unique values after 99.)

Stored results

inspect stores the following in r():

Scalars
- r(N) number of observations
- r(N_neg) number of negative observations
- r(N_0) number of observations equal to 0
- r(N_pos) number of positive observations
- r(N_negint) number of negative integer observations
- r(N_posint) number of positive integer observations
- r(N_unique) number of unique values or . if more than 99
- r(N_undoc) number of undocumented values or . if not labeled
