Syntax

Produce a codebook describing value labels

```
{\tt labelbook} \ \left[ \textit{lblname-list} \ \right] \ \left[ \ \textit{,} \ \textit{labelbook\_options} \ \right]
```

Prefix numeric values to value labels

```
numlabel \lceil lblname-list \rceil, \{ \underline{a}dd | \underline{r}emove \} \lceil numlabel\_options \rceil
```

Make dataset containing value-label information

```
uselabel [lblname-list] [using filename] [, clear \underline{var}]
```

labelbook_options	Description
alpha length(#) list(#) problems detail	alphabetize label mappings check if value labels are unique to length #; default is length(12) list maximum of # mappings; default is list(32000) describe potential problems in a summary report do not suppress detailed report on variables or value labels

$numlabel_options$	Description
* <u>a</u> dd	prefix numeric values to value labels
$*\underline{r}$ emove	remove numeric values from value labels
$\underline{\mathtt{m}}$ ask(str)	mask for formatting numeric labels; default mask is "#. "
force	force adding or removing of numeric labels
<u>d</u> etail	provide details about value labels, where some labels are prefixed with numbers and others are not

^{*} Either add or remove must be specified.

Menu

labelbook

Data > Data utilities > Label utilities > Produce codebook of value labels

numlabel

Data > Data utilities > Label utilities > Prepend values to value labels

uselabel

Data > Data utilities > Label utilities > Create dataset from value labels

Description

labelbook displays information for the value labels specified or, if no labels are specified, all the labels in the data.

For multilingual datasets (see [D] label language), labelbook lists the variables to which value labels are attached in all defined languages.

numlabel prefixes numeric values to value labels. For example, a value mapping of 2 -> "catholic" will be changed to 2 -> "2. catholic". See option mask() for the different formats. Stata commands that display the value labels also show the associated numeric values. Prefixes are removed with the remove option.

uselabel is a programmer's command that reads the value-label information from the currently loaded dataset or from an optionally specified filename.

uselabel creates a dataset in memory that contains only that value-label information. The new dataset has four variables named label, lname, value, and trunc; is sorted by lname value; and has 1 observation per mapping. Value labels can be longer than the maximum string length in Stata; see [R] limits. The new variable trunc contains 1 if the value label is truncated to fit in a string variable in the dataset created by uselabel.

uselabel complements label, save, which produces a text file of the value labels in a format that allows easy editing of the value-label texts.

Specifying no list or _all is equivalent to specifying all value labels. Value-label names may not be abbreviated or specified with wildcards.

Options

Options are presented under the following headings:

Options for labelbook Options for numlabel Options for uselabel

Options for labelbook

alpha specifies that the list of value-label mappings be sorted alphabetically on label. The default is to sort the list on value.

length(#) specifies the minimum length that labelbook checks to determine whether shortened
value labels are still unique. It defaults to 12, the width used by most Stata commands. labelbook
also reports whether value labels are unique at their full length.

list(#) specifies the maximum number of value-label mappings to be listed. If a value label defines more mappings, a random subset of # mappings is displayed. By default, labelbook displays all mappings. list(0) suppresses the listing of the value-label definitions.

problems specifies that a summary report be produced describing potential problems that were diagnosed:

- 1. Value label has gaps in mapped values (for example, values 0 and 2 are labeled, while 1 is not)
- 2. Value label strings contain leading or trailing blanks
- 3. Value label contains duplicate labels, that is, there are different values that map into the same string

- 4. Value label contains duplicate labels at length 12
- 5. Value label contains numeric \rightarrow numeric mappings
- 6. Value label contains numeric \rightarrow null string mappings
- 7. Value label is not used by variables

detail may be specified only with problems. It specifies that the detailed report on the variables or value labels not be suppressed.

Options for numlabel

add specifies that numeric values be prefixed to value labels. Value labels that are already numlabeled (using the same mask) are not modified.

remove specifies that numeric values be removed from the value labels. If you added numeric values by using a nondefault mask, you must specify the same mask to remove them. Value labels that are not numlabeled or are numlabeled using a different mask are not modified.

mask(str) specifies a mask for formatting the numeric labels. In the mask, # is replaced by the numeric label. The default mask is "#. " so that numeric value 3 is shown as "3. ". Spaces are relevant. For the mask "[#]", numeric value 3 would be shown as "[3]".

force specifies that adding or removing numeric labels be performed, even if some value labels are numlabeled using the mask and others are not. Here only labels that are not numlabeled will be modified.

detail specifies that details be provided about the value labels that are sometimes, but not always, numlabeled using the mask.

Options for uselabel

clear permits the dataset to be created, even if the dataset already in memory has changed since it was last saved.

var specifies that the varlists using value label vl be returned in r(vl).

Remarks and examples

stata.com

Remarks are presented under the following headings:

labelbook Diagnosing problems numlabel uselabel

labelbook

labelbook produces a detailed report of the value labels in your data. You can restrict the report to a list of labels, meaning that no abbreviations or wildcards will be allowed. labelbook is a companion command to [D] codebook, which describes the data, focusing on the variables.

For multilingual datasets (see [D] label language), labelbook lists the variables to which value labels are attached in any of the languages.

Example 1

We request a labelbook report for value labels in a large dataset on the internal organization of households. We restrict output to three value labels: agree5 (used for five-point Likert-style items), divlabor (division of labor between husband and wife), and noves for simple no-or-yes questions.

- . use http://www.stata-press.com/data/r13/labelbook1
- . labelbook agree5 divlabor noyes

```
value label agree5
      values
                                                labels
       range:
              [1,5]
                                         string length:

             ves
        .a
             not applicable
        .b
             ambiguous answer
             hb12 hd01_a hd01_b hd03 hd04_a hd04_b he03_a he03_b hlat hn09_b
 variables:
             hn24_a hn34 hn49 hu05_a hu06_1c hu06_2c hx07_a hx08 hlat2
             hfinish rh02 rj10_01 rk16_a rk16_b rl01 rl03 rl08_a rl08_b
             rl09_a rs047 rs048 rs049 rs050 rs051 rs052 rs053 rs054 rs093
             rs095 rs096 rs098
```

The report is largely self-explanatory. Extended missing values are denoted by ".*". In the definition of the mappings, the leading 12 characters of longer value labels are underlined to make it easier to check that the value labels still make sense after truncation. The following example emphasizes this feature. The option alpha specifies that the value-label mappings be sorted in alphabetical order by the label strings rather than by the mapped values.

```
. use http://www.stata-press.com/data/r13/labelbook2
```

. labelbook sports, alpha

```
value label sports
```

```

             professional basketball
 variables:
             active passive
```

The report includes information about potential problems in the data. These are discussed in greater detail in the next section.

Diagnosing problems

labelbook can diagnose a series of potential problems in the value-label mappings. labelbook produces warning messages for a series of problems:

1. Gaps in the labeled values (for example, values 0 and 2 are labeled, whereas 1 is not) may occur when value labels of the intermediate values have not been defined.

- 2. Leading or trailing blanks in the value labels may distort Stata output.
- 3. Stata allows you to define blank labels, that is, the mapping of a number to the empty string. Below we give you an example of the unexpected output that may result. Blank labels are most often the result of a mistaken value-label definition, for instance, the expansion of a nonexisting macro in the definition of a value label.
- 4. Stata does not require that the labels within each value label consist of *unique* strings, that is, that different values be mapped into different strings. For instance, you might accidentally define the value label gender as

```
label define gender 1 female 2 female
```

You will probably catch most of the problems, but in more complicated value labels, it is easy to miss the error. labelbook finds such problems and displays a warning.

- 5. Stata allows long value labels (32,000 characters), so labels can be long. However, some commands may need to display truncated value labels, typically at length 12. Consequently, even if the value labels are unique, the truncated value labels may not be, which can cause problems. labelbook warns you for value labels that are not unique at length 12.
- 6. Stata allows value labels that can be interpreted as numbers. This is sometimes useful, but it can cause highly misleading output. Think about tabulating a variable for which the associated value label incorrectly maps 1 into "2", 2 into "3", and 3 into "1". labelbook looks for such problematic labels and warns you if they are found.
- 7. In Stata, value labels are defined as separate objects that can be associated with more than one variable:

```
label define labname # str # str ....
label value varname1 labname
label value varname2 labname
...
```

If you forget to associate a variable label with a variable, Stata considers the label unused and drops its definition. labelbook reports unused value labels so that you may fix the problem.

The related command codebook reports on two other potential problems concerning value labels:

- a. A variable is value labeled, but some values of the variable are not labeled. You may have forgotten to define a mapping for some values, or you generated a variable incorrectly; for example, your sex variable has an unlabeled value 3, and you are not working in experimental genetics!
- b. A variable has been associated with an undefined value label.

labelbook can also be invoked with the problems option, specifying that only a report on potential problems be displayed without the standard detailed description of the value labels.

□ Technical note

The following two examples demonstrate some features of value labels that may be difficult to understand. In the first example, we encode a string variable with blank strings of various sizes; that is, we turn a string variable into a value-labeled numeric variable. Then we tabulate the generated variable.

- . clear all
- . set obs 5

obs was 0, now 5

- . generate str10 horror = substr(" ", 1, _n)
- . encode horror, gen(Ihorror)
- . tabulate horror

horror	Freq.	Percent	Cum.
	1	20.00	20.00
	1	20.00	40.00
	1	20.00	60.00
	1	20.00	80.00
	1	20.00	100.00
Total	5	100.00	

It may look as if you have discovered a bug in Stata because there are no value labels in the first column of the table. This happened because we encoded a variable with only blank strings, so the associated value label maps integers into blank strings.

. label list Ihorror

Ihorror:

2

3

4

5

In the first column of the table, tabulate displayed the value-label texts, just as it should. Because these texts are all blank, the first column is empty. As illustrated below, labelbook would have warned you about this odd value label.

Our second example illustrates what could go wrong with numeric values stored as string values. We want to turn this into a numeric variable, but we incorrectly encode the variable rather than using the appropriate command, destring.

- . generate str10 horror2 = string(_n+1)
- . encode horror2, gen(Ihorror2)
- . tabulate Ihorror2

Cum.	Percent	Freq.	Ihorror2	
20.00	20.00	1	2	
40.00	20.00	1	3	
60.00	20.00	1	4	
80.00	20.00	1	5	
100.00	20.00	1	6	
	100.00	5	Total	

. tabulate Ihorror2, nolabel

Ihorror2	Freq.	Percent	Cum.
1	1	20.00	20.00
2	1	20.00	40.00
3	1	20.00	60.00
4	1	20.00	80.00
5	1	20.00	100.00
Total	5	100.00	

. label list Ihorror2

Ihorror2:

3 4

labelbook skips the detailed descriptions of the value labels and reports only the potential problems in the value labels if the problems option is specified. This report would have alerted you to the problems with the value labels we just described.

- . use http://www.stata-press.com/data/r13/data_in_trouble, clear
- . labelbook, problem

Potential problems in dataset http://www.stata-press.com/data/r13/

> data_in_trouble.dta

potential problem value labels

numeric -> numeric Ihorror2
leading or trailing blanks Ihorror
not used by variables unused

Running labelbook, problems and codebook, problems on new data might catch a series of annoying problems.

numlabel

The numlabel command allows you to prefix numeric codes to value labels. The reason you might want to do this is best seen in an example using the automobile data. First, we create a value label for the variable rep78 (repair record in 1978),

- . use http://www.stata-press.com/data/r13/auto
 (1978 Automobile Data)
- . label define repair 1 "very poor" 2 "poor" 3 "medium" 4 good 5 "very good"
- . label values rep78 repair

and tabulate it.

. tabulate rep78

Repair Record 1978	Freq.	Percent	Cum.
very poor	2	2.90	2.90
poor	8	11.59	14.49
medium	30	43.48	57.97
good	18	26.09	84.06
very good	11	15.94	100.00
Total	69	100.00	

Suppose that we want to recode the variable by joining the categories *poor* and *very poor*. To do this, we need the numerical codes of the categories, not the value labels. However, Stata does not display both the numeric codes and the value labels. We could redisplay the table with the nolabel option. The numlabel command provides a simple alternative: it modifies the value labels so that they also contain the numeric codes.

- . numlabel, add
- . tabulate rep78

Repair Record 1978	Freq.	Percent	Cum.
1. very poor	2	2.90	2.90
2. poor	8	11.59	14.49
3. medium	30	43.48	57.97
4. good	18	26.09	84.06
5. very good	11	15.94	100.00
Total	69	100.00	

If you do not like the way the numeric codes are formatted, you can use numlabel to change the formatting. First, we remove the numeric codes again:

. numlabel repair, remove

In this example, we specified the name of the label. If we had not typed it, numlabel would have removed the codes from all the value labels. We can include the numeric codes while specifying a mask:

- . numlabel, add mask("[#] ")
- . tabulate rep78

Repair Record 1978	Freq.	Percent	Cum.
[1] very poor	2	2.90	2.90
[2] poor	8	11.59	14.49
[3] medium	30	43.48	57.97
[4] good	18	26.09	84.06
[5] very good	11	15.94	100.00
Total	69	100.00	

numlabel prefixes rather than postfixes the value labels with numeric codes. Because value labels can be fairly long (up to 80 characters), Stata usually displays only the first 12 characters.

uselabel is of interest primarily to programmers. Here we briefly illustrate it with the auto dataset.

Example 2

. use http://www.stata-press.com/data/r13/auto
(1978 Automobile Data)

. uselabel

. describe

Contains data

obs: 2 vars: 4 size: 32

variable name	storage type	display format	value label	variable label
lname	str6	%9s		
value	byte	%9.0g		
label	str8	%9s		
trunc	byte	%9.0g		

Sorted by: lname value

Note: dataset has changed since last saved

. list

	lname	value	label	trunc
1. 2.	origin origin	0	Domestic Foreign	0

uselabel created a dataset containing the labels and values for the value label origin.

The maximum length of the text associated with a value label is 32,000 characters, whereas the maximum length of a string variable in a Stata dataset is 2,045. uselabel uses only the first 2,045 characters of the label. The trunc variable will record a 1 if the text was truncated for this reason.

Stored results

labelbook stores the following in r():

Macros

r(names) lblname-list

r(gaps) gaps in mapped values r(blanks) leading or trailing blanks

r(null) name of value label containing null strings

r(nuniq) duplicate labels

r(nuniq_sh) duplicate labels at length 12

r(ntruniq) duplicate labels at maximum string length

r(notused) not used by any of the variables

r(numeric) name of value label containing mappings to numbers

1

uselabel stores the following in r():

Macros

r(lblname) list of variables that use value label lblname (only when var option is specified)

Acknowledgments

labelbook and numlabel were written by Jeroen Weesie of the Department of Sociology at Utrecht University, The Netherlands. A command similar to numlabel was written by J. M. Lauritsen (2001) of Odense Universiteshospital, Denmark.
