# Title

#### graph twoway histogram — Histogram plots

Syntax Description Options for use in the continuous case Remarks and examples Also see Menu Options for use in the discrete case Options for use in both cases References

# Syntax

twoway histogram varname [if] [in] [weight]

[, [discrete\_options | continuous\_options] common\_options]

discrete_options	Description
<u>disc</u> rete	specify that data are discrete
<u>w</u> idth(#)	width of bins in varname units
start(#)	theoretical minimum value
continuous_options	Description
bin(#)	# of bins
<u>w</u> idth(#)	width of bins in varname units
start(#)	lower limit of first bin
common_options	Description
<u>den</u> sity	draw as density; the default
<u>frac</u> tion	draw as fractions
frequency	draw as frequencies
percent	draw as percents
<u>vert</u> ical	vertical bars; the default
<u>hor</u> izontal	horizontal bars
gap(#)	reduce width of bars, $0 \le \# < 100$
barlook_options	change look of bars
axis_choice_options	associate plot with alternative axis
twoway_options	titles, legends, axes, added lines and text, by, regions, name, aspect ratio, etc.

See [G-3] *barlook\_options*, [G-3] *axis\_choice\_options*, and [G-3] *twoway\_options*.

fweights are allowed; see [U] 11.1.6 weight.

#### Menu

Graphics > Twoway graph (scatter, line, etc.)

# Description

twoway histogram draws histograms of *varname*. Also see [R] histogram for an easier-to-use alternative.

## Options for use in the discrete case

- discrete specifies that *varname* is discrete and that each unique value of *varname* be given its own bin (bar of histogram).
- width(#) is rarely specified in the discrete case; it specifies the width of the bins. The default is width(d), where d is the observed minimum difference between the unique values of varname.

Specify width() if you are concerned that your data are sparse. For example, *varname* could in theory take on the values 1, 2, 3, ..., 9, but because of sparseness, perhaps only the values 2, 4, 7, and 8 are observed. Here the default width calculation would produce width(2), and you would want to specify width(1).

start(#) is also rarely specified in the discrete case; it specifies the theoretical minimum value of
varname. The default is start(m), where m is the observed minimum value.

As with width(), specify start() when you are concerned about sparseness. In the previous example, you would also want to specify start(1). start() does nothing more than add white space to the left side of the graph.

start(), if specified, must be less than or equal to m, or an error will be issued.

## Options for use in the continuous case

bin(#) and width(#) are alternatives that specify how the data are to be aggregated into bins. bin() specifies the number of bins (from which the width can be derived), and width() specifies the bin width (from which the number of bins can be derived).

If neither option is specified, the results are the same as if bin(k) were specified, where

$$k = \min\left(\sqrt{N}, 10 \times \frac{\ln(N)}{\ln(10)}\right)$$

and where N is the number of nonmissing observations of *varname*.

start(#) specifies the theoretical minimum of varname. The default is start(m), where m is the
observed minimum value of varname.

Specify start() when you are concerned about sparse data. For instance, you might know that *varname* can go down to 0, but you are concerned that 0 may not be observed.

start(), if specified, must be less than or equal to m, or an error will be issued.

# Options for use in both cases

density, fraction, frequency, and percent are alternatives that specify whether you want the histogram scaled to density, fractional, or frequency units, or percentages. density is the default.

density scales the height of the bars so that the sum of their areas equals 1.

fraction scales the height of the bars so that the sum of their heights equals 1.

frequency scales the height of the bars so that each bar's height is equal to the number of observations in the category, and thus the sum of the heights is equal to the total number of nonmissing observations of *varname*.

percent scales the height of the bars so that the sum of their heights equals 100.

- vertical and horizontal specify whether the bars are to be drawn vertically (the default) or horizontally.
- gap(#) specifies that the bar width be reduced by # percent. gap(0) is the default; histogram sets the width so that adjacent bars just touch. If you wanted gaps between the bars, you would specify, for instance, gap(5).

Also see [G-2] graph twoway rbar for other ways to set the display width of the bars. Histograms are actually drawn using twoway rbar with a restriction that 0 be included in the bars; twoway histogram will accept any options allowed by twoway rbar.

- *barlook\_options* set the look of the bars. The most important of these options is color (*colorstyle*), which specifies the color of the bars; see [G-4] *colorstyle* for a list of color choices. See [G-3] *barlook\_options* for information on the other *barlook\_options*.
- *axis\_choice\_options* associate the plot with a particular y or x axis on the graph; see [G-3] *axis\_choice\_options*.
- *twoway\_options* are a set of common options supported by all twoway graphs. These options allow you to title graphs, name graphs, control axes and legends, add lines and text, set aspect ratios, create graphs over by() groups, and change some advanced settings. See [G-3] *twoway\_options*.

## **Remarks and examples**

#### stata.com

Remarks are presented under the following headings:

Relationship between graph twoway histogram and histogram Typical use Use with by() History

#### Relationship between graph twoway histogram and histogram

graph twoway histogram—documented here—and histogram—documented in [R] histogram—are almost the same command. histogram has the advantages that

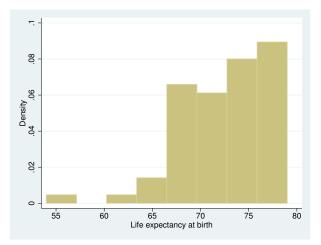

- 1. it allows overlaying of a normal density or a kernel estimate of the density;
- 2. if a density estimate is overlaid, it scales the density to reflect the scaling of the bars.

histogram is implemented in terms of graph twoway histogram.

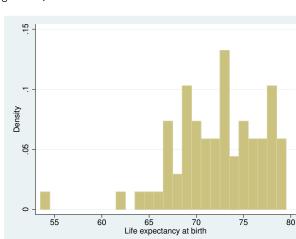

### Typical use

When you do not specify otherwise, graph twoway histogram assumes that the variable is continuous:

```
. use http://www.stata-press.com/data/r13/lifeexp
(Life expectancy, 1998)
. twoway histogram le
```

Even with a continuous variable, you may specify the discrete option to see the individual values:

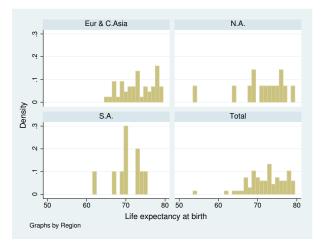

. twoway histogram le, discrete

## Use with by()

graph twoway histogram may be used with by():

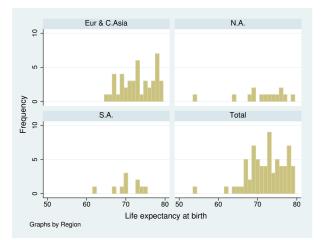

```
. use http://www.stata-press.com/data/r13/lifeexp, clear
(Life expectancy, 1998)
```

```
. twoway histogram le, discrete by(region, total)
```

Here specifying frequency is a good way to show both the distribution and the overall contribution to the total:

. twoway histogram le, discrete freq by(region, total)

The height of the bars reflects the number of countries. Here—and in all the above examples—we would do better by obtaining population data on the countries and then typing

. twoway histogram le [fw=pop], discrete freq by(region, total)

so that bar height reflected total population.

#### History

According to Beniger and Robyn (1978, 4), although A. M. Guerry published a histogram in 1833, the word "histogram" was first used by Karl Pearson in 1895.
