## Syntax

|              |                |
|--------------|----------------|
| $a + b$      | addition       |
| $a - b$      | subtraction    |
| $a * b$      | multiplication |
| $a / b$      | division       |
| $a \wedge b$ | power          |
| $-a$         | negation       |

where  $a$  and  $b$  may be numeric scalars, vectors, or matrices.

## Description

The above operators perform basic arithmetic.

## Remarks and examples

stata.com

Also see [M-2] [op\\_colon](#) for the `:+`, `:-`, `:*`, and `:/` operators. Colon operators have relaxed conformability restrictions.

The `*` and `:*` multiplication operators can also perform string duplication—`3*"a" = "aaa"`—see [M-5] [strdup\(\)](#).

## Conformability

$a + b$ ,  $a - b$ :

|                 |              |
|-----------------|--------------|
| <i>a</i> :      | $r \times c$ |
| <i>b</i> :      | $r \times c$ |
| <i>result</i> : | $r \times c$ |

$a * b$ :

|                 |              |              |              |
|-----------------|--------------|--------------|--------------|
| <i>a</i> :      | $k \times n$ | $k \times n$ | $1 \times 1$ |
| <i>b</i> :      | $n \times m$ | $1 \times 1$ | $n \times m$ |
| <i>result</i> : | $k \times m$ | $k \times n$ | $n \times m$ |

$a / b$ :

|                 |              |
|-----------------|--------------|
| <i>a</i> :      | $r \times c$ |
| <i>b</i> :      | $1 \times 1$ |
| <i>result</i> : | $r \times c$ |

$a \wedge b$ :

|                 |              |
|-----------------|--------------|
| <i>a</i> :      | $1 \times 1$ |
| <i>b</i> :      | $1 \times 1$ |
| <i>result</i> : | $1 \times 1$ |

$-a$ :  
    *a*:      $r \times c$   
    *result*:      $r \times c$

## Diagnostics

All operators return missing when arguments are missing.

$a*b$  with  $a$ :  $k \times 0$  and  $b$ :  $0 \times m$  returns a  $k \times m$  matrix of zeros.

$a/b$  returns missing when  $b==0$  or when  $a/b$  would result in overflow.

$a^b$  returns a real when both  $a$  and  $b$  are real; thus,  $(-4)^.5$  evaluates to missing, whereas  $(-4+0i)^.5$  evaluates to  $2i$ .

$a^b$  returns missing on overflow.
