

sqrt() — Square root[Syntax](#)[Description](#)[Conformability](#)[Diagnostics](#)[Also see](#)

Syntax

numeric matrix `sqrt(numeric matrix Z)`

Description

`sqrt(Z)` returns the elementwise square root of Z .

Conformability

`sqrt(Z)`

Z: $r \times c$
result: $r \times c$

Diagnostics

`sqrt(Z)` returns missing when Z is real and $Z < 0$; that is, `sqrt(-4) = .` but `sqrt(-4+0i) = 2i`.
