

**strreverse()** — Reverse string

[Syntax](#)[Description](#)[Remarks and examples](#)[Conformability](#)[Diagnostics](#)[Also see](#)

## Syntax

*string matrix* `strreverse(string matrix s)`

## Description

`strreverse(s)` returns *s* with its characters in reverse order.

When *s* is not a scalar, `strreverse()` returns element-by-element results.

## Remarks and examples

[stata.com](#)

Stata understands `strreverse()` as a synonym for its own `reverse()` function, so you can use the `strreverse()` name in both your Stata and Mata code.

## Conformability

`strreverse(s)`

*s*:  $r \times c$   
*result*:  $r \times c$

## Diagnostics

None.
