> **mi copy —** Copy mi flongsep data

Syntax

> mi copy *newname* [, replace]

Menu

Statistics > Multiple imputation

Description

mi copy *newname* copies flongsep data in memory to *newname* and sets it so that you are working with that copy. *newname* may not be specified with the .dta suffix.

In detail, mi copy *newname* 1) completes saving the flongsep data to its current name if that is necessary; 2) copies the data to *newname*.dta, _1_*newname*.dta, _2_*newname*.dta, ..., _M_*newname*.dta; and 3) tells mi that you are now working with *newname*.dta in memory.

mi copy can also be used with wide, mlong, or flong data, although there is no reason you would want to do so. The data are not saved to the original filename as flongsep data would be, but otherwise actions are the same: the data in memory are copied to *newname*.dta, and *newname*.dta is loaded into memory.

Option

replace specifies that it is okay to overwrite *newname*.dta, _1_*newname*.dta, _2_*newname*.dta, ..., if they already exist.

Remarks and examples stata.com

In Stata, one usually works with a copy of the data in memory. Changes you make to the data are not saved in the underlying disk file until and unless you explicitly save your data. That is not true when working with flongsep data.

Flongsep data are a matched set of datasets, one containing $m = 0$, another containing $m = 1$, and so on. You work with one of them in memory, namely, $m = 0$, but as you work, the other datasets are automatically updated; as you make changes, the datasets on disk change.

Therefore, it is best to work with a copy of your flongsep data and then periodically save the data to the real files, thus mimicking how you work with ordinary Stata datasets. mi copy is for just that purpose. After loading your flongsep data, type, for example,

```
. use myflongsep
```

1

and immediately make a copy,

        . mi copy *newname*

You are now working with the same data but under a new name. Your original data are safe.

When you reach a point where you would ordinarily save your data, whether under the original name or a different one, type

        . mi copy *original_name_or_different_name* , replace
        . use *newname*

Later, when you are done with *newname*, you can erase it by typing

        . mi erase *newname*

Concerning erasure, you will discover that mi erase will not let you erase the files when you have one of the files to be erased in memory. Then you will have to type

        . mi erase *newname*, clear

See [MI] **mi erase** for more information.

For more information on flongsep data, see *Advice for using flongsep* in [MI] **styles**.
