### Syntax

```stata
matrix svd U w V = A
```

where U, w, and V are matrix names (the matrices may exist or not) and A is the name of an existing \( m \times n \) matrix, \( m \geq n \).

---

### Description

`matrix svd` produces the singular value decomposition (SVD) of A.

Also see [M-5] `svd()` for alternative routines for obtaining the singular value decomposition.

---

### Remarks and examples

The singular value decomposition of \( m \times n \) matrix A, \( m \geq n \), is defined as

\[
A = U \text{diag}(w)V'
\]

where \( U \): \( m \times n \), \( w \): \( 1 \times n \), \( \text{diag}(w) \): \( n \times n \), and \( V \): \( n \times n \), where U is column orthogonal (\( U'U = I \) if \( m = n \)), all the elements of \( w \) are positive or zero, and \( V'V = I \).

Singular value decomposition can be used to obtain a g2-inverse of A (\( A^* \): \( n \times m \), such that \( AA^*A = A \) and \( A^*AA^* = A^* \)—the first two Moore–Penrose conditions) via \( A^* = V\{\text{diag}(1/w_j}\}U' \), where \( 1/w_j \) refers to individually taking the reciprocal of the elements of \( w \) and substituting 0 if \( w_j = 0 \) or is small. If A is square and of full rank, \( A^* = A^{-1} \).

#### Example 1

Singular value decomposition is used to obtain accurate inverses of nearly singular matrices and to obtain g2-inverses of matrices that are singular, to construct orthonormal bases, and to develop approximation matrices. Our example will prove that `matrix svd` works:

```stata
. matrix A = (1,2,9\2,7,5\2,4,18)
. matrix svd U w V = A
. matrix list U
U[3,3]
  c1   c2   c3
r1 .423 13293  .89442719   -.1447706
r2 .3237169    -6.016e-17   .94615399
r3 .84626585   -.4472136   -.2895412
. matrix list w
w[1,3]
  c1   c2   c3
r1  21.832726  2.612e-16   5.5975071
```
. matrix list V
V[3,3]
    c1   c2   c3
  c1  .12655765  .96974658  .2087456
  c2  .29759672  -.23786237  .92458514
  c3  .94626601  -.05489132  -.31869671
. matrix newA = U*diag(w)*V'
. matrix list newA
newA[3,3]
      c1  c2  c3
  r1  1   2   9
  r2  2   7   5
  r3  2   4  18

As claimed, newA is equal to our original A.

The g2-inverse of A is computed below. The second element of w is small, so we decide to set the corresponding element of diag(1/wj) to zero. We then show that the resulting Ainv matrix has the properties of a g2-inverse for A.

. matrix Winv = J(3,3,0)
. matrix Winv[1,1] = 1/w[1,1]
. matrix Winv[3,3] = 1/w[1,3]
. matrix Ainv = V*Winv*U'
. matrix list Ainv
Ainv[3,3]
   r1  r2  r3
  c1  -.0029461  .03716103  -.0058922
  c2  -.0181453  .16069635  -.03629059
  c3  .02658185  -.0398393  .05316371
. matrix AAiA = A*Ainv*A
. matrix list AAiA
AAiA[3,3]
   c1  c2  c3
  r1  1   2   9
  r2  2   7   5
  r3  2   4  18
. matrix AiAAi = Ainv*A*Ainv
. matrix list AiAAi
AiAAi[3,3]
   r1  r2  r3
  c1  -.0029461  .03716103  -.0058922
  c2  -.0181453  .16069635  -.03629059
  c3  .02658185  -.0398393  .05316371

Methods and formulas

Stewart (1993) surveys the contributions of five mathematicians—Beltrami, Jordan, Sylvester, Schmidt, and Weyl—who established the existence of the singular value decomposition and developed its theory.
