Title

> **more —** Pause until key is pressed

Syntax

> <u>mor</u>e

Description

more causes Stata to display —more— and pause until any key is pressed if more is set on and does nothing if more is set off.

The current value of set more is stored in c(more); see [P] **creturn**.

See [R] **more** for information on set more on and set more off.

Remarks and examples

Ado-file programmers need take no special action to have —more— conditions arise when the screen is full. Stata handles that automatically.

If, however, you wish to force a —more— condition early, you can include the more command in your program. The syntax of more is

> more

more takes no arguments.
