estat eqtest — Equation-level test that all coefficients are zero

Syntax Menu Remarks and examples Stored results

Description ults Also see Option

Syntax

```
estat eqtest [, total nosvyadjust]
```

Menu

Statistics > SEM (structural equation modeling) > Testing and CIs > Equation-level Wald tests

Description

estat eqtest is for use after sem but not gsem.

estat eqtest displays Wald tests that all coefficients excluding the intercept are 0 for each equation in the model.

Option

- total is for use when estimation was with sem, group(). It specifies that the tests be aggregated across the groups.
- nosvyadjust is for use with svy estimation commands. It specifies that the Wald test be carried out without the default adjustment for the design degrees of freedom. That is to say the test is carried out as $W/k \sim F(k, d)$ rather than as $(d k + 1)W/(kd) \sim F(k, d k + 1)$, where k is the dimension of the test and d is the total number of sampled PSUs minus the total number of strata.

Remarks and examples

stata.com

See [SEM] example 13.

Stored results

estat eqtest stores the following in r():

Scalars	
r(N_groups)	number of groups
Matrices	
r(nobs)	sample size for each group
r(test [] #])	test statistics (for group #)
r(test_total)	aggregated test statistics (total only)
