Description

`estat summarize` is a standard postestimation command of Stata. This entry concerns use of `estat summarize` after `sem` or `gsem`.

`estat summarize` reports the summary statistics in the estimation sample for the observed variables in the model. `estat summarize` is mentioned here because

1. `estat summarize` cannot be used if `sem` was run on summary statistics data; see [**SEM**] [intro 11](#).

2. `estat summarize` allows the additional option `group` after estimation by `sem`.

If you fit your model with `gsem` instead of `sem`, see [**R**] [estat summarize](#).

Options

`group` may be specified if `group(varname)` was specified with `sem` at the time the model was fit.

It requests that summary statistics be reported by `group`.

`estat_summ_options` are the standard options allowed by `estat summarize` and are outlined in [Options of \[R\] estat summarize](#).

Stored results

See [Stored results of \[R\] estat summarize](#).
