## Syntax

```
tssmooth nl [type] newvar = exp [if] [in], smoother(smoothers[, twice])
[replace]
```

where `smoother` is specified as `Sm[Sm[...]]` and `Sm` is one of

```
{1|2|3|4|5|6|7|8|9}[R]
3[R]S[S|R][S|R]...E
H
```

The numbers specified in `smoother` represent the span of a running median smoother. For example, a number 3 specifies that each value be replaced by the median of the point and the two adjacent data values. The letter H indicates that a Hanning linear smoother, which is a span-3 smoother with binomial weights, be applied.

The letters E, S, and R are three refinements that can be combined with the running median and Hanning smoothers. First, the end points of a smooth can be given special treatment. This is specified by the E operator. Second, smoothing by 3, the span-3 running median, tends to produce flat-topped hills and valleys. The splitting operator, S, “splits” these repeated values, applies the end-point operator to them, and then “rejoins” the series. Third, it is sometimes useful to repeat an odd-span median smoother or the splitting operator until the smooth no longer changes. Following a digit or an S with an R specifies this type of repetition.

Finally, the `twice` operator specifies that after smoothing, the smoother be reapplied to the resulting rough, and any recovered signal be added back to the original smooth.

Letters may be specified in lowercase, if preferred. Examples of `smoother[, twice]` include

```
3RSSH 3RSSH,twice 4253H 4253H,twice 43RSR2H,twice
3rssh 3rssh,twice 4253h 4253h,twice 43rser2h,twice
```

You must `tsset` your data before using `tssmooth nl`; see [TS] `tsset`.

`exp` may contain time-series operators; see [U] 11.4.4 Time-series varlists.

## Menu

Statistics > Time series > Smoothers/univariate forecasters > Nonlinear filter
Description
tssmooth nl uses nonlinear smoothers to identify the underlying trend in a series.

Options

smoother(smooth [twice]) is required; it specifies the nonlinear smoother to be used.
replace replaces newvar if it already exists.

Remarks and examples

stata.com
tssmooth nl works as a front end to smooth. See [R] smooth for details.

Stored results
tssmooth nl stores the following in r():

Scalars
r(N) number of observations

Macros
r(method) nl
r(smoother) specified smoother
r(timevar) time variable specified in tsset
r(panelvar) panel variable specified in tsset

Methods and formulas

The methods are documented in [R] smooth.
A truncated description of the specified nonlinear filter labels the new variable. See [D] label for more information on labels.
An untruncated description of the specified nonlinear filter is saved in the characteristic tssmooth for the new variable. See [P] char for more information on characteristics.
