Title

> **graph twoway qfitci —** Twoway quadratic prediction plots with CIs

Description

twoway qfitci calculates the prediction for *yvar* from a regression of *yvar* on *xvar* and *xvar*^{2} and plots the resulting line along with a confidence interval.

Quick start

Graph of the quadratic prediction of y using x and x^2 with 95% confidence interval (CI)

    twoway qfitci y x

Add an overlaid scatterplot of the observed data

    twoway qfitci y x || scatter y x

As above, but calculate CI using the standard error for an individual forecast

    twoway qfitci y x, stdf || scatter y x

With a 90% confidence interval

    twoway qfitci y x, level(90) || scatter y x

Suppress the legend

    twoway qfitci y x || scatter y x, legend(off)

As above, but plot confidence limits as lines

    twoway qfitci y x, ciplot(rline) || scatter y x, legend(off)

As above, and reduce the size of the scatterplot markers

    twoway qfitci y x, ciplot(rline) || scatter y x, legend(off) ///
        msize(.8)

Menu

Graphics > Twoway graph (scatter, line, etc.)

Syntax

> twoway qfitci *yvar* *xvar* [*if*] [*in*] [*weight*] [, *options*]

options	Description
stdp	CIs from SE of prediction; the default
stdf	CIs from SE of forecast
stdr	CIs from SE of residual; seldom specified
level(#)	set confidence level; default is level(95)
range(# #)	range over which predictions are calculated
n(#)	number of prediction points
atobs	calculate predictions at *xvar*
estopts(*regress_options*)	options for regress
predopts(*predict_options*)	options for predict
nofit	do not plot the prediction
fitplot(*plottype*)	how to plot fit; default is fitplot(line)
ciplot(*plottype*)	how to plot CIs; default is ciplot(rarea)
fcline_options	change look of predicted line
fitarea_options	change look of CI
axis_choice_options	associate plot with alternative axis
twoway_options	titles, legends, axes, added lines and text, by, regions, name, aspect ratio, etc.

Options range(), estopts() predopts(), n(), and level() are *rightmost*, and atobs, nofit, fitplot(), ciplot(), stdp, stdf, and stdr are *unique*; see [G-4] **concept: repeated options**.

yvar and *xvar* may contain time-series operators; see [U] **11.4.4 Time-series varlists**.

aweights, fweights, and pweights are allowed. Weights, if specified, affect estimation but not how the weighted results are plotted. See [U] **11.1.6 weight**.

Options

stdp, stdf, and stdr determine the basis for the confidence interval. stdp is the default.

　stdp specifies that the confidence interval be the confidence interval of the mean.

　stdf specifies that the confidence interval be the confidence interval for an individual forecast, which includes both the uncertainty of the mean prediction and the residual.

　stdr specifies that the confidence interval be based only on the standard error of the residual.

level(#) specifies the confidence level, as a percentage, for the confidence intervals. The default is level(95) or as set by set level; see [U] **20.7 Specifying the width of confidence intervals**.

range(# #) specifies the x range over which predictions are calculated. The default is range(. .), meaning the minimum and maximum values of *xvar*. range(0 10) would make the range 0 to 10, range(. 10) would make the range the minimum to 10, and range(0 .) would make the range 0 to the maximum.

n(#) specifies the number of points at which the predictions and the CI over range() are to be calculated. The default is n(100).

atobs is an alternative to n() and specifies that the predictions be calculated at the *xvar* values. atobs is the default if predopts() is specified and any statistic other than the xb is requested.

estopts(*regress_options*) specifies options to be passed along to regress to estimate the linear regression from which the curve will be predicted; see [R] **regress**. If this option is specified, commonly specified is estopts(nocons).

predopts(*predict_options*) specifies options to be passed along to predict to obtain the predictions after estimation by regress; see [R] **regress postestimation**.

nofit prevents the prediction from being plotted.

fitplot(*plottype*), which is seldom used, specifies how the prediction is to be plotted. The default is fitplot(line), meaning that the prediction will be plotted by graph twoway line. See [G-2] **graph twoway** for a list of *plottype* choices. You may choose any that expect one y and one x variable.

ciplot(*plottype*) specifies how the confidence interval is to be plotted. The default is ciplot(rarea), meaning that the prediction will be plotted by graph twoway rarea.

A reasonable alternative is ciplot(rline), which will substitute lines around the prediction for shading. See [G-2] **graph twoway** for a list of *plottype* choices. You may choose any that expect two y variables and one x variable.

fcline_options specify how the prediction line is rendered; see [G-3] ***fcline_options***. If you specify fitplot(), then rather than using *fcline_options*, you should select options that affect the specified *plottype* from the options in scatter; see [G-2] **graph twoway scatter**.

fitarea_options specify how the confidence interval is rendered; see [G-3] ***fitarea_options***. If you specify ciplot(), then rather than using *fitarea_options*, you should specify whatever is appropriate.

axis_choice_options associate the plot with a particular y or x axis on the graph; see [G-3] ***axis_choice_options***.

twoway_options are a set of common options supported by all twoway graphs. These options allow you to title graphs, name graphs, control axes and legends, add lines and text, set aspect ratios, create graphs over by() groups, and change some advanced settings. See [G-3] ***twoway_options***.

# Remarks and examples   stata.com

Remarks are presented under the following headings:

Typical use

twoway qfitci by default draws the confidence interval of the predicted mean:

```
. use http://www.stata-press.com/data/r14/auto
(1978 Automobile Data)
. twoway qfitci mpg weight
```

If you specify the ciplot(rline) option, rather than shading the confidence interval, it will be designated by lines:

```
. twoway qfitci mpg weight, ciplot(rline)
```
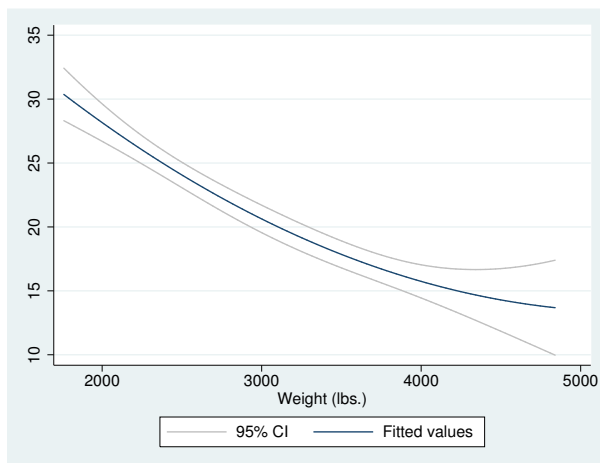

Advanced use

`qfitci` can be overlaid with other plots:

```
. use http://www.stata-press.com/data/r14/auto, clear
(1978 Automobile Data)
. twoway qfitci mpg weight, stdf || scatter mpg weight
```

In the above command, we specified `stdf` to obtain a confidence interval based on the standard error of the forecast rather than the standard error of the mean. This is more useful for identifying outliers.

We typed

```
. twoway qfitci ... || scatter ...
```
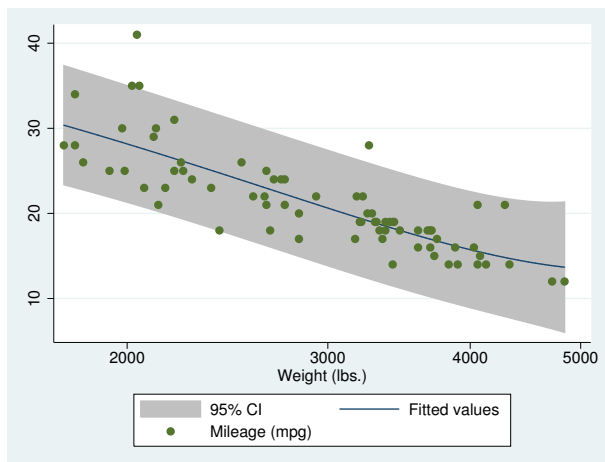

and not

```
. twoway scatter ... || qfitci ...
```

Had we drawn the scatter diagram first, the confidence interval would have covered up most of the points.

Cautions

Do not use `twoway qfitci` when specifying the *axis_scale_options*
`yscale(log)` or `xscale(log)` to create log scales. Typing

```
. twoway qfitci mpg weight, stdf || scatter mpg weight ||, xscale(log)
```

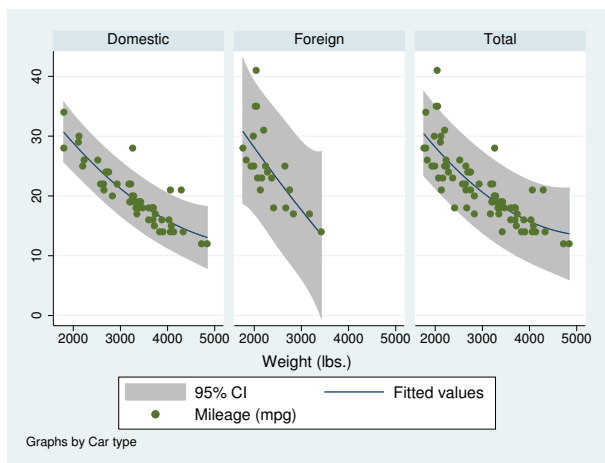

The result may look pretty but, if you think about it, it is not what you want. The prediction line is not a parabola because the regression estimated for the prediction was for mpg on `weight` and `weight^2`, not mpg on `log(weight)` and `log(weight)^2`.

Use with by( )

`qfitci` may be used with `by()` (as can all the `twoway` plot commands):

```
. twoway qfitci  mpg weight, stdf ||
         scatter mpg weight       ||
          , by(foreign, total row(1))
```
