

**graph twoway rarea** — Range plot with area shading[Description](#)  
[Options](#)[Quick start](#)  
[Remarks and examples](#)[Menu](#)  
[Also see](#)[Syntax](#)

## Description

A range plot has two  $y$  variables, such as high and low daily stock prices or upper and lower 95% confidence limits.

`twoway rarea` plots range as a shaded area.

Also see [\[G-2\] graph twoway area](#) for area plots filled to the axis.

## Quick start

A range plot with area shading and sorted by ascending values of  $x$

```
twoway rarea y1 y2 x, sort
```

A horizontal area plot

```
twoway rarea y1 y2 x, sort horizontal
```

Allow missing values to create gaps in the area

```
twoway rarea y1 y2 x, sort cmissing(n)
```

Specify navy area and lines

```
twoway rarea y1 y2 x, sort fcolor(navy) lcolor(navy)
```

As above, but reduce the area color intensity to 30%

```
twoway rarea y1 y2 x, sort fcolor(navy) fintensity(30) lcolor(navy)
```

## Menu

Graphics > Twoway graph (scatter, line, etc.)

## Syntax

```
twoway rarea y1var y2var xvar [if] [in] [, options]
```

<i>options</i>	Description
<u>vertical</u>	vertical area plot; the default
<u>horizontal</u>	horizontal area plot
<u>cmissing(y n)</u>	missing values do not force gaps in area; default is <code>cmissing(y)</code>
<u>sort</u>	sort by <i>xvar</i> ; recommended
<i>area_options</i>	change look of shaded areas
<i>axis_choice_options</i>	associate plot with alternative axis
<i>twoway_options</i>	titles, legends, axes, added lines and text, by, regions, name, aspect ratio, etc.

All explicit options are *unique*; see [G-4] **concept: repeated options**.

## Options

`vertical` and `horizontal` specify whether the high and low *y* values are to be presented vertically (the default) or horizontally.

In the default `vertical` case, *y1var* and *y2var* record the minimum and maximum (or maximum and minimum) *y* values to be graphed against each *xvar* value.

If `horizontal` is specified, the values recorded in *y1var* and *y2var* are plotted in the *x* direction and *xvar* is treated as the *y* value.

`cmissing(y|n)` specifies whether missing values are to be ignored when drawing the area or if they are to create breaks in the area. The default is `cmissing(y)`, meaning that they are ignored.

Consider the following data:

	y	x
1.	1	1
2.	3	2
3.	5	3
4.	.	.
5.	6	5
6.	11	8

Say that you graph these data by using `twoway rarea y x`. Do you want a break in the area between 3 and 5? If so, you type

```
. twoway rarea y x, cmissing(n)
```

and two areas will be drawn, one for the observations before the missing values at observation 4 and one for the observations after the missing values.

If you omit the option (or type `missing(y)`), the data are treated as if they contained

	y	x
1.	1	1
2.	3	2
3.	5	3
4.	6	5
5.	11	8

meaning that one contiguous area will be drawn over the range (1,8).

`sort` specifies that the data be sorted by *xvar* before plotting.

*area\_options* set the look of the shaded areas. The most important of these options is `color(colorstyle)`, which specifies the color of both the area and its outline; see [G-4] [colorstyle](#) for a list of color choices. See [G-3] [area\\_options](#) for information on the other *area\_options*.

*axis\_choice\_options* associate the plot with a particular *y* or *x* axis on the graph; see [G-3] [axis\\_choice\\_options](#).

*twoway\_options* are a set of common options supported by all `twoway` graphs. These options allow you to title graphs, name graphs, control axes and legends, add lines and text, set aspect ratios, create graphs over `by()` groups, and change some advanced settings. See [G-3] [twoway\\_options](#).

## Remarks and examples

[stata.com](http://www.stata.com)

Remarks are presented under the following headings:

*Typical use*  
*Advanced use*  
*Cautions*

### Typical use

We have daily data recording the values for the S&P 500 in 2001:

```
. use http://www.stata-press.com/data/r14/sp500
(S&P 500)
. list date high low close in 1/5
```

	date	high	low	close
1.	02jan2001	1320.28	1276.05	1283.27
2.	03jan2001	1347.76	1274.62	1347.56
3.	04jan2001	1350.24	1329.14	1333.34
4.	05jan2001	1334.77	1294.95	1298.35
5.	08jan2001	1298.35	1276.29	1295.86

## 4 graph twoway rarea — Range plot with area shading

We will use the first 57 observations from these data:

```
. twoway rarea high low date in 1/57
```

### Advanced use

`rarea` works particularly well when the upper and lower limits are smooth functions and when the area is merely shaded rather than given an eye-catching color:

```
. use http://www.stata-press.com/data/r14/auto, clear  
(1978 Automobile Data)  
. quietly regress mpg weight  
. predict hat  
(option xb assumed; fitted values)  
. predict s, stdf  
. generate low = hat - 1.96*s  
. generate hi = hat + 1.96*s  
. twoway rarea low hi weight, sort color(gs14) ||  
  scatter mpg weight
```

Notice the use of option `color()` to change the color of the shaded area. Also, we graphed the shaded area first and then the scatter. Typing

```
. twoway scatter ... || rarea ...
```

would not have produced the desired result because the shaded area would have covered up the scatterplot.

Also see [G-2] [graph twoway lfitci](#).

## Cautions

Be sure that the data are in the order of *xvar*, or specify `rarea`'s `sort` option. If you do neither, you will get something that looks like modern art; see *Cautions* in [G-2] [graph twoway area](#) for an example.
