substr( ) — Extract substring

Description

`substr(`*s*`,` *b*`,` *l*`)` returns the substring of ASCII string *s* starting at position *b* and continuing for a length of *l* characters.

For non-ASCII strings, *b* and *l* are interpreted as byte positions. To obtain character-based substrings of Unicode strings, see [M-5] **usubstr( )**.

`substr(`*s*`,` *b*`)` is equivalent to `substr(`*s*`,` *b*`, .)` for strings that do not contain binary 0. If there is a binary 0 to the right of *b*, the substring from *b* up to but not including the binary 0 is returned.

When arguments are not scalar, `substr()` returns element-by-element results.

Syntax

string matrix `substr(`*string matrix s*`,` *real matrix b*`,` *real matrix l*`)`

string matrix `substr(`*string matrix s*`,` *real matrix b*`)`

Remarks and examples

stata.com

`substr(`*s*`,` *b*`,` *l*`)` returns the substring of ASCII string *s* starting at position *b* and continuing for a length of *l*, where

1. *b* specifies the starting position; the first character of the string is $b = 1$.
2. $b > 0$ is interpreted as distance from the start of the string; $b = 2$ means starting at the second character.
3. $b < 0$ is interpreted as distance from the end of string; $b = -1$ means starting at the last character; $b = -2$ means starting at the second from the last character.
4. *l* specifies the length; $l = 2$ means for two characters.
5. $l < 0$ is treated the same as $l = 0$: no characters are copied.
6. $l \geq$ `.` is interpreted to mean to the end of the string.

`substr(`*s*`,` *b*`)` is equivalent to `substr(`*s*`,` *b*`, .)` for strings that do not contain binary 0. If there is a binary 0 to the right of *b*, the substring from *b* up to but not including the binary 0 is returned.

If your string contains Unicode characters, see [M-5] **usubstr( )** and [M-5] **udsubstr( )**.

Conformability

`substr(`*s*`, `*b*`, `*l*`)`:

s:	$r_1 \times c_1$
b:	$r_2 \times c_2$
l:	$r_3 \times c_3$; *s*, *b*, and *l* r-conformable
result:	$\max(r_1, r_2, r_3) \times \max(c_1, c_2, c_3)$

`substr(`*s*`, `*b*`)`:

s:	$r_1 \times c_1$
b:	$r_2 \times c_2$; *s* and *b* r-conformable
result:	$\max(r_1, r_2) \times \max(c_1, c_2)$

Diagnostics

In `substr(`*s*`, `*b*`, `*l*`)` and `substr(`*s*`, `*b*`)`, if *b* describes a position before the beginning of the string or after the end, `""` is returned. If $b + l$ describes a position to the right of the end of the string, results are as if a smaller value for *l* were specified.
