# Unpacking the Green Wage Premium: <br> The Role of Observables and Unobservables in the Wages of the Green Jobs 

# Sergey Volozhenin, João Cerejeira \& Rita Sousa EEG - UMinho 

2024 Portugal Stata Research Symposium
26 January 2024

## Motivation

- Concern with the environment and green transition
- Paris Agreement 2015;
- Resolution of the Council of Ministers No. 107/2019 - Roadmap to Carbon Neutrality 2050-90\% of GHG until 2050;
- Resolution of the Council of Ministers No. 53/2020 - National Energy and Climate Plan 2030-32.5\% of energy consumption and $40 \%$ of GHG until 2030.
- Worldwide rising popularity of green employment measurement issues
- Institutional - European Commission (2007), Eurostat (2009), Bezdek (2009), US Department of Commerce (2010), BLS (2012; 2013), Ecorys (2012), BIS (2013), IRENA (2013-2019), Office for National Statistics (2020), Eurostat (2021);
- Independent Researchers - Consoli et al. (2016), Bowen et al. (2018), Vona et al. (2018), Bowen and Hanck'e (2019), Georgeson and Maslin (2019), Valero et al. (2021).
- Very scarce information about Portugal

## Green jobs \& green skills

- There is no unique definition of green jobs. However, is it possible to group them by:
- Sector/industry (OCDE, Eurostat, US Department of Commerce, UNEP, ILO, ITUC, BIS) - Top-down approach
- Occupation, task and skill (O*NET and ESCO) - Bottom-up approach
- Dierdorff et al. (2009), under O*NET program "Green Economy", issued a set of professions to whom activities and technologies of green economy will:
- Increase demand - Green Increased Demand Occupations;
- Transform the skills and requirements needed to execute the tasks - Green Enhanced Skills Occupations;
- Create new and unique jobs - Green New and Emerging Occupations.
- O*NET also issues a list of green tasks resulting from changes in work and worker requirements due to the impact of green activities and technologies.

## Green occupations: from O*NET to ISCO08/CPP2010

## Dataset

- Quadros de Pessoal dataset
- Longitudinal data set (LEED) that matches firms and workers;
- Collected through a mandatory annual survey provided by the Ministry of Employment and Social Security;
- Aggregates individual demographic and job information about workers from the private sector;
- A unique fictitious number identifies each worker and firm where they are employed. Thus they are unrecognizable but traceable.

## Dataset 1: All workers

|  | Mean | SD | Min | Max | N |
| :--- | ---: | ---: | ---: | ---: | ---: |
| Time spawn |  |  |  |  |  |

[^0]The green wage premium
Model 2

$$
\ln \left(H W_{i f t}\right)=\mathbf{X}_{i f t}^{\prime} \boldsymbol{\beta}^{G, N G}+\alpha_{i}+G_{i f t} \times \alpha_{i}+\theta_{f}+\tau_{t}+\epsilon_{i f t}
$$

In matrix form:

$$
\mathbf{Y}=\mathbf{X} \boldsymbol{\beta}+\mathbf{D} \boldsymbol{\alpha}+\mathbf{G D} \boldsymbol{\gamma}+\boldsymbol{\varepsilon}
$$

## Estimation model 2

- Apply the Frisch-Waugh-Lovell (FWL) theorem:
- Expurgate from $Y$ and $X$ the effect of $D$ and $G D$.
- Calculate the residuals $\mathbf{e}_{\mathbf{Y}}=M Y$ and $\mathbf{e}_{\mathbf{X}}=M X$ where $M$ is the projection matrix $M=I-Z\left(Z^{\prime} Z\right) Z^{\prime}$ with Z=[D GD]
- By the FWL theorem a regression of $\mathbf{e}_{\mathbf{Y}}$ on $\mathbf{e}_{\mathbf{X}}$ yields the OLS estimate of $\boldsymbol{\beta}$.
- The estimates for $\boldsymbol{\alpha}$ and $\boldsymbol{\gamma}$ are obtained similarly.
- We can do this using the STATA command regintfe, a Stata module to estimate a linear regression model with one interacted high dimensional fixed effect, by Paulo Guimarães and Pedro Portugal (2010). "A Simple Feasible Alternative Procedure to Estimate Models with High-Dimensional Fixed Effects", Stata Journal, 10(4), 628-649.

## help for reghintfe

Title
reghintfe - Estimates a linear regression model with one interacted high dimensional fixed effect.
Syntax
reghintfe depvar [indepvar] [if] [in] , id1(varname) intvar(varname) [options]

## Description

This command estimates a linear regression model with one high-dimensional interacted fixed effect. The command makes use of the Frisch-Waugh-Lovell result to avoid computing the dummy variables and the interactions for the fixed effects. Because of this it can be used with a very large number of groups for the fixed effect.

## Options

id1(varname) fixed effect variable. This option is required.
intvar(varname) variables that interact with the fixed effect. This option is required.
cluster(varname) computes clustered standard errors.
verbose gives more information during estimation.

## Results model 2

- Negative correlation between $\boldsymbol{\alpha}$ and $\gamma$ :

$$
\rho_{\alpha \gamma}=-0,21^{* * *}
$$

returns to unobservable workers' skills decrease with the degree of the greenness of occupations

## The green wage premium - Displaced workers sample

Table 8: Green wage premium displaced workers.

|  | OLS |  | FE |  | HDFE |  |

$\rho_{\alpha \gamma}=-0,170^{* * *}$
Results are robust to endogenous worker occupation mobility

## Summary and conclusions

- Workers in green jobs receive on average $11 \%$ more than (observable) similar workers in non-green occupations;
- Moving to a green(er) occupation have a positive impact on wages;
- Returns to unobservable workers' abilities decrease as the degree of "greenness" of an occupation increases.
- Further research is needed to explain the later result.
