Description

`bmagraph msize` provides a graphical summary for the posterior and prior model-size distributions after the `bmaregress` command.

Quick start

Plot posterior and prior model-size distributions after fitting a Bayesian model averaging (BMA) linear regression

```
bmagraph msize
```

Same as above, but plot the posterior model-size distribution only

```
bmagraph msize, noprior
```

Menu

Statistics > Bayesian model averaging > Model-size distributions

Syntax

```
bmagraph msize [ , options ]
```

| <i>options</i> | Description |
|--|---|
| Main | |
| <code>constant</code> | include constant term in model-size computations; default is no constant |
| <code>noprior</code> | suppress prior model-size distribution shown by default |
| <code>priorlineopts(<i>cline_options</i>)</code> | affect rendition of prior line |
| <code>anlineopts(<i>cline_options</i>)</code> | affect rendition of analytical posterior line; ignored with random <i>g</i> |
| <code>frequlineopts(<i>cline_options</i>)</code> | affect rendition of frequency posterior line; ignored with model enumeration |
| <code>postlineopts(<i>cline_options</i>)</code> | affect rendition of all posterior lines |
| Line options | |
| <code><i>cline_options</i></code> | affect rendition of all plotted lines |
| Y axis, X axis, Titles, Legend, Overall | |
| <code><i>twoway_options</i></code> | any options other than <code>by()</code> documented in [G-3] twoway_options |

Options

Main

`constant` specifies that the constant term be included in model-size computations. By default, the constant term is not included.

`noprior` specifies that the prior model-size distribution not be shown on the plot. It is shown by default.

`priorlineopts(cline_options)` affects the rendition of the prior line; see [G-3] [cline_options](#).

`anlineopts(cline_options)` affects the rendition of the analytical posterior line; see [G-3] [cline_options](#). This option is ignored for BMA models with a random g .

`freqlineopts(cline_options)` affects the rendition of the frequency posterior line; see [G-3] [cline_options](#). The frequency model-size distribution is plotted whenever sampling is used. This option is ignored with model enumeration.

`postlineopts(cline_options)` affects the rendition of the analytical and frequency posterior lines; see [G-3] [cline_options](#).

Line options

`cline_options` affects the rendition of all plotted lines; see [G-3] [cline_options](#).

Y axis, X axis, Titles, Legend, Overall

`twoway_options` are any of the options documented in [G-3] [twoway_options](#), excluding `by()`. These include options for titling the graph (see [G-3] [title_options](#)) and for saving the graph to disk (see [G-3] [saving_option](#)).

Remarks and examples

[stata.com](http://www.stata.com)

See [Remarks and examples](#) in [BMA] [bmastats msize](#) for a general discussion of a BMA model size.

A model-size distribution is used to explore model complexity. The prior model-size distribution describes our a priori assumption about model size. The posterior model-size distribution describes the effect of the data on the BMA model. For this purpose, we compare the posterior and prior model-size distributions. If the posterior is skewed to the left with respect to the prior, then the data favor smaller models than assumed by the prior. If the posterior is skewed to the right, then the data favor larger models than assumed by the prior.

For the prior model-size distribution, `bmagraph msize` always uses analytical computation. In the case of sampling, it is conditional on the visited models. For the posterior model-size distribution, it plots the analytical distribution for a fixed g and the MCMC frequency-based or simply frequency distribution for a random g and whenever sampling is used.

► Example 1: Model-size distributions for BMA models using enumeration

We consider the performance dataset (Chatterjee and Hadi 2012, sec. 3.3) analyzed in [example 1](#) of [BMA] [bmastats msize](#). In that example, we explored only a few summaries of the model-size distributions. Here we describe the entire distributions.

The rating variable is regressed on all predictors from `complaints` to `advance`. By default, because of the small number of predictors, six, the model space is explored fully by using enumeration.

```

. use https://www.stata-press.com/data/r18/performance
(Data on employee satisfaction with supervisor)
. bmaregress rating complaints-advance

Enumerating models ...
Computing model probabilities ...

Bayesian model averaging
Linear regression
Model enumeration
No. of obs           = 30
No. of predictors    = 6
Groups               = 6
Always              = 0
No. of models        = 64
For CPMP >= .9      = 10
Mean model size      = 1.699

Priors:
Models: Beta-binomial(1, 1)
Cons.: Noninformative
Coef.: Zellner's g
      g: Benchmark, g = 36
      sigma2: Noninformative
Shrinkage, g/(1+g) = 0.9730
Mean sigma2        = 52.302
    
```

| rating | Mean | Std. dev. | Group | PIP |
|------------|-----------|-----------|-------|---------|
| complaints | .7052859 | .1224289 | 1 | .99973 |
| learning | .0603014 | .1285281 | 3 | .25249 |
| advance | -.0167921 | .073883 | 6 | .13148 |
| privileges | -.0074174 | .0488635 | 2 | .10998 |
| raises | .0070789 | .0670475 | 4 | .10642 |
| critical | .0009713 | .0437848 | 5 | .098534 |
| <hr/> | | | | |
| Always | | | | |
| _cons | 14.8472 | 7.874219 | 0 | 1 |

Note: Coefficient posterior means and std. dev. estimated from 64 models.
Note: Default priors are used for models and parameter g.

There is a total of $2^6 = 64$ models in the fully explored model space. Let's use `bmagraph msize` to draw the posterior and prior model-size distributions.

```

. bmagraph msize
note: frequency posterior model-size distribution not available.
    
```

The reported model size does not include the constant, so its range is between 0 and 6. You may include the constant by specifying the `constant` option. By default, an uninformative uniform prior is assumed for the model size. The posterior model-size distribution is skewed to the left. Its mode is 1, so the posterior favors smaller models.

A frequency-based posterior estimate of the model-size distribution is not available in this example because there is no MCMC sample with model enumeration.

▷ **Example 2: Model-size distributions for BMA models using MCMC model composition (MC3) sampling**

Continuing with [example 1](#), we fit the same BMA model, but this time we use the MC3 sampling algorithm by specifying the `sampling` option. We also specify the `rseed()` option for reproducibility.

```
. bmaregress rating complaints-advance, sampling rseed(18)
Burn-in ...
Simulation ...
Computing model probabilities ...
Bayesian model averaging          No. of obs          = 30
Linear regression                 No. of predictors   = 6
MC3 sampling                       Groups              = 6
                                   Always                 = 0
                                   No. of models       = 32
                                   For CPMP >= .9     = 10
Priors:                            Mean model size    = 1.699
  Models: Beta-binomial(1, 1)      Burn-in            = 2,500
  Cons.: Noninformative           MCMC sample size   = 10,000
  Coef.: Zellner's g              Acceptance rate     = 0.2417
    g: Benchmark, g = 36          Shrinkage, g/(1+g) = 0.9730
    sigma2: Noninformative        Mean sigma2        = 52.292
Sampling correlation = 0.9990
```

| rating | Mean | Std. dev. | Group | PIP |
|------------|-----------|-----------|-------|---------|
| complaints | .705479 | .1218881 | 1 | 1 |
| learning | .0601919 | .1282869 | 3 | .25234 |
| advance | -.0167514 | .0737415 | 6 | .13141 |
| privileges | -.0074265 | .048844 | 2 | .10996 |
| raises | .0069949 | .0666406 | 4 | .10629 |
| critical | .0009699 | .0437742 | 5 | .098526 |
| Always | | | | |
| _cons | 14.84478 | 7.871046 | 0 | 1 |

Note: Coefficient posterior means and std. dev. estimated from 32 models.

Note: Default priors are used for models and parameter *g*.

Instead of enumerating models (fully exploring the space), `bmaregress` explored only half the model space. It visited 32 out of the total 64 models. We inspect the effect of this on the prior and posterior model-size distributions.

```
. bmagraph msize
```

Although we used the same model prior as in [example 1](#), the prior model-size distribution looks different. This is because our explored model space now contains 32 models instead of all 64, and the prior model-size distribution is conditional on the visited models.

The model of size 1, the one that includes `complaints`, has the highest posterior probability of about 0.56.

With a fixed g when we fit a BMA model using MC3 sampling, in addition to the analytical model-size distribution, the frequency posterior model-size distribution is available. Provided that the model-space sampling converges, the analytical and frequency distributions should be close. In our example, the analytical and frequency model-size distributions are nearly identical.

▷ Example 3: Model-size distributions for BMA models with random g

Both [example 1](#) and [example 2](#) used a fixed g . Let's explore the case of a random g . (An in-depth coverage of the effects of the g -prior on model complexity can be found in, for example, [Ley and Steel \[2012\]](#).)

To demonstrate, we will use a robust prior for g .

```
. bmaregress rating complaints-advance, gprior(robust) rseed(18)
Burn-in ...
Simulation ...
Computing model probabilities ...
Bayesian model averaging                No. of obs      =    30
Linear regression                       No. of predictors =     6
MC3 and adaptive MH sampling            Groups         =     6
                                         Always         =     0
                                         No. of models  =    34
                                         For CPMP >= .9 =    12
                                         Mean model size =  1.734
Priors:                                  Burn-in        =  2,500
Models: Beta-binomial(1, 1)             MCMC sample size = 10,000
Cons.: Noninformative                  Acceptance rate =  0.4232
Coef.: Zellner's g
g: Robust
sigma2: Noninformative                  Mean sigma2     = 53.095
Sampling correlation = 0.9994
```

| rating | Mean | Std. dev. | Group | PIP |
|------------|-----------|-----------|-------|-------|
| complaints | .7000463 | .1273543 | 1 | .9998 |
| learning | .0594904 | .1286095 | 3 | .25 |
| advance | -.0192712 | .0797935 | 6 | .1503 |
| raises | .0079416 | .0727859 | 4 | .1201 |
| privileges | -.0072591 | .0487009 | 2 | .1069 |
| critical | .0014397 | .0466476 | 5 | .1067 |
| Always | | | | |
| _cons | 15.24911 | 7.988166 | 0 | 1 |

Note: Coefficient posterior means and std. dev. estimated from 34 models.

Note: Default prior is used for models.

| | Mean | Std. dev. | MCSE | Median | Equal-tailed [95% cred. interval] | |
|-----------|----------|-----------|---------|----------|--------------------------------------|----------|
| g | 152.668 | 1968.132 | 43.5265 | 33.81024 | 8.205076 | 610.6026 |
| Shrinkage | .9656427 | .0276071 | .001234 | .9712728 | .8913639 | .9983649 |

`bmaregress` now uses MC3 sampling for the models and adaptive Metropolis–Hastings sampling for g .

```
. bmagraph msize
note: analytical posterior model-size distribution not available.
```

The analytical posterior model-size distribution is not available with a random g . The frequency posterior model-size distribution is similar to that in [example 2](#) for fixed $g = 36$. Particularly, the null model was not visited by the MC3 sampler, and models of size 1 and 2 have the highest posterior probabilities (both above 0.2), but the mode of the posterior distribution here is 1.
