bayes: clogit — Bayesian conditional logistic regression

Description

bayes: clogit fits a Bayesian conditional logistic regression to matched case–control data; see [BAYES] bayes and [R] clogit for details.

Quick start

Bayesian conditional logistic regression of y on x1 and x2, using default normal priors for regression coefficients

bayes: clogit y x1 x2, group(id)

Use a standard deviation of 10 instead of 100 for the default normal priors

bayes, normalprior(10): clogit y x1 x2, group(id)

Use uniform priors for the slopes and a normal prior for the intercept

bayes, prior({y: x1 x2}, uniform(-10,10)) ///
prior({y:_cons}, normal(0,10)): clogit y x1 x2, group(id)

Save simulation results to simdata.dta, and use a random-number seed for reproducibility

bayes, saving(simdata) rseed(123): clogit y x1 x2, group(id)

Specify 20,000 MCMC samples, set length of the burn-in period to 5,000, and request that a dot be displayed every 500 simulations

bayes, mcmcsize(20000) burnin(5000) dots(500): clogit y x1 x2, group(id)

In the above, request that the 90% HPD credible interval be displayed instead of the default 95% equal-tailed credible interval

bayes, clevel(90) hpd

Display odds ratios instead of coefficients

bayes: clogit y x1 x2, group(id) or

Display odds ratios on replay

bayes, or

## Syntax

```
bayes [, bayesopts] : clogit depvar [indepvars] [if] [in] [weight],
group(varname) [options]
```

<table>
<thead>
<tr>
<th>options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>group(varname)</code></td>
<td>matched group variable</td>
</tr>
<tr>
<td><code>offset(varname)</code></td>
<td>include varname in model with coefficient constrained to 1</td>
</tr>
</tbody>
</table>

**Model**

- `group(varname)` is required.
- `indepvars` may contain factor variables; see [U] 11.4.3 Factor variables.
- fweights are allowed; see [U] 11.1.6 weight. fweights are interpreted to apply to groups as a whole, not to individual observations. See Use of weights in [R] clogit.

bayes: clogit, level() is equivalent to bayes, clevel(): clogit.

For a detailed description of `options`, see Options in [R] clogit.

## bayesopts

<table>
<thead>
<tr>
<th>Priors</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>normalprior(#)</code></td>
<td>specify standard deviation of default normal priors for regression coefficients; default is normalprior(100)</td>
</tr>
<tr>
<td><code>prior(priorspec)</code></td>
<td>prior for model parameters; this option may be repeated</td>
</tr>
<tr>
<td><code>dryrun</code></td>
<td>show model summary without estimation</td>
</tr>
</tbody>
</table>

**Simulation**

- number of chains; default is to simulate one chain
- MCMC sample size; default is mcmcs(10000)
- burn-in period; default is burnin(2500)
- thinning interval; default is thinning(1)
- random-number seed
- specify model parameters to be excluded from the simulation results

**Blocking**

- maximum block size; default is blocksize(50)
- specify a block of model parameters; this option may be repeated
- display block summary
- do not block parameters by default
Initialization

initial(initspec) specify initial values for model parameters with a single chain
init#(initspec) specify initial values for #th chain; requires nchains()
initall(initspec) specify initial values for all chains; requires nchains()
nomleinit suppress the use of maximum likelihood estimates as starting values
initrandom specify random initial values
initsummary display initial values used for simulation
*noisily display output from the estimation command during initialization

Adaptation

adaptation(adaptopts) control the adaptive MCMC procedure
scale(#) initial multiplier for scale factor; default is scale(2.38)
covariance(cov) initial proposal covariance; default is the identity matrix

Reporting

clevel(#) set credible interval level; default is clevel(95)
hpd display HPD credible intervals instead of the default equal-tailed credible intervals
*or report odds ratios
eform[(string)] report exponentiated coefficients and, optionally, label as string
batch(#) specify length of block for batch-means calculations; default is batch(0)
saving(filename[, replace]) save simulation results to filename.dta
nomodelsummary suppress model summary
chandsdetail display detailed simulation summary for each chain
[no] dots suppress dots or display dots every 100 iterations and iteration numbers every 1,000 iterations; default is nodots
dots(#[, every(#)]) display dots as simulation is performed
[no]show(paramref) specify model parameters to be excluded from or included in the output
notable suppress estimation table
noheader suppress output header
title(string) display string as title above the table of parameter estimates
display_options control spacing, line width, and base and empty cells

Advanced

search(search_options) control the search for feasible initial values
corrlag(#) specify maximum autocorrelation lag; default varies
corrtol(#) specify autocorrelation tolerance; default is corrtol(0.01)

*Starred options are specific to the bayes prefix; other options are common between bayes and bayesmh.
Options prior() and block() may be repeated.
priorspec and paramref are defined in [BAYES] bayesmh.
paramref may contain factor variables; see [U] 11.4.3 Factor variables.
See [U] 20 Estimation and postestimation commands for more capabilities of estimation commands.
Model parameters are regression coefficients {depvar:indepvars}. Use the dryrun option to see the definitions of model parameters prior to estimation.
For a detailed description of bayesopts, see Options in [BAYES] bayes.
Remarks and examples

For a general introduction to Bayesian analysis, see [BAYES] Intro. For a general introduction to Bayesian estimation using an adaptive Metropolis–Hastings algorithm, see [BAYES] bayesmh. For remarks and examples specific to the bayes prefix, see [BAYES] bayes. For details about the estimation command, see [R] clogit.

For a simple example of the bayes prefix, see Introductory example in [BAYES] bayes.

Stored results
