by — Repeat Stata command on subsets of the data

Description Quick start Syntax Options
Remarks and examples References Also see

Description

Most Stata commands allow the by prefix, which repeats the command for each group of observations for which the values of the variables in *varlist* are the same. by without the sort option requires that the data be sorted by *varlist*; see [D] **sort**.

Stata commands that work with the by prefix indicate this immediately following their syntax diagram by reporting, for example, "by is allowed; see [D] by" or "bootstrap, by, etc., are allowed; see [U] 11.1.10 Prefix commands".

by and bysort are really the same command; bysort is just by with the sort option.

The $varlist_1$ ($varlist_2$) syntax is of special use to programmers. It verifies that the data are sorted by $varlist_1$ varlist_2 and then performs a by as if only $varlist_1$ were specified. For instance,

```
by pid (time): generate growth = (bp - bp[\_n-1])/bp
```

performs the generate by values of pid but first verifies that the data are sorted by pid and time within pid.

Quick start

Generate newv as an observation number within each level of catvar

by catvar: generate newv = $_n$

Same as above, but sort data by catvar first

by catvar, sort: generate newv = n

Same as above

bysort catvar: generate newv = _n

Same as above, but sort by v within values of catvar

bysort catvar (v): generate newv = _n

Generate news as an observation number for each observation in levels of catvar and v

bysort catvar v: generate newv = _n

Note: Any command that accepts the by prefix may be substituted for generate above.

Syntax

```
by varlist: stata_cmd
bysort varlist: stata_cmd
```

The above diagrams show by and bysort as they are typically used. The full syntax of the commands is

```
by varlist_1[(varlist_2)][, \underline{s}ortrc0]: stata\_cmd
bysort varlist<sub>1</sub> [(varlist<sub>2</sub>)] [, rc0]: stata_cmd
```

Options

sort specifies that if the data are not already sorted by *varlist*, by should sort them.

rc0 specifies that even if the *stata_cmd* produces an error in one of the by-groups, then by is still to run the stata_cmd on the remaining by-groups. The default action is to stop when an error occurs. rc0 is especially useful when stata_cmd is an estimation command and some by-groups have insufficient observations.

Remarks and examples

Example 1

```
. use https://www.stata-press.com/data/r19/autornd
(1978 automobile data)
. keep in 1/20
(54 observations deleted)
. by mpg: egen mean_w = mean(weight)
not sorted
r(5);
. sort mpg
. by mpg: egen mean_w = mean(weight)
```

. list

	make	weight	mpg	mean_w
1.	Cad. Eldorado	4000	15	3916.667
2.	AMC Pacer	3500	15	3916.667
3.	Chev. Impala	3500	15	3916.667
4.	Buick Electra	4000	15	3916.667
5.	Buick Riviera	4000	15	3916.667
6.	Cad. Deville	4500	15	3916.667
7.	AMC Spirit	2500	20	3350
8.	Chev. Monte Carlo	3000	20	3350
9.	Chev. Malibu	3000	20	3350
10.	Buick Skylark	3500	20	3350
11.	Buick Regal	3500	20	3350
12.	Buick LeSabre	3500	20	3350
13.	AMC Concord	3000	20	3350
14.	Chev. Nova	3500	20	3350
15.	Cad. Seville	4500	20	3350
16.	Buick Century	3500	20	3350
17.	Buick Opel	2000	25	2500
18.	Chev. Monza	3000	25	2500
19.	Dodge Colt	2000	30	2000
20.	Chev. Chevette	2000	30	2000

by requires that the data be sorted. In the above example, we could have typed by mpg, sort: egen mean_w = mean(weight) or bysort mpg: egen mean_w = mean(weight) rather than the separate sort; all would yield the same results.

For more examples, see [U] 11.1.2 by varlist:, [U] 11.5 by varlist: construct, and [U] 13.7 Explicit subscripting. For extended introductions with detailed examples, see Cox (2002) and Mitchell (2020, chap. 8).

Technical note

by repeats the stata_cmd for each group defined by varlist. If stata_cmd stores results, only the results from the last group on which stata_cmd executes will be stored.
