

**Description**

`varmanage` opens the Variables Manager. The Variables Manager allows for the sorting and filtering of variables for the purpose of setting properties on one or more variables at a time. Variable properties include the name, label, storage type, format, value label, and notes. The Variables Manager also can be used to create `varlists` for the Command window.

**Menu**

Data > Variables Manager

**Syntax**

`varmanage`

**Remarks and examples**

A tutorial discussion of `varmanage` can be found in [GS] 7 Using the Variables Manager (GSM, GSU, or GSW).
