Example 1b — Interval regression with continuous endogenous covariate

Description

Continuing from [ERM] Example 1a, we now consider the case where the dependent variable is interval-censored. We fit this model using `eintreg`.

Remarks and examples

We now assume that, for reasons of confidentiality, the researchers conducting the study do not observe the actual college GPA for those with a GPA below 2.0. For the rest, they are given college GPA only in increments of 0.5 points. So the outcome has both left- and interval-censored observations. The model remains the same.

The lower and upper endpoints for college GPA are stored in `gpal` and `gpau`. Both variables contain a missing value for students who dropped out of college. Other than the change in command name and specification of the dependent variable, the command to fit the model is exactly the same.

```
eintreg gpal gpau income, endogenous(hsgpa = income i.hscomp)
```

Output:

```
Iteration 0: log likelihood = -1716.9969
Iteration 1: log likelihood = -1716.9968
Extended interval regression

Number of obs      = 1,528
Uncensored         = 0
Left-censored      = 150
Right-censored    = 0
Interval-cens.     = 1,378
Log likelihood     = -1716.9968

Wald chi2(2)       = 912.68
```

```
|           | Coef. | Std. Err. | z    | P>|z| |  [95% Conf. Interval] |
|-----------|-------|-----------|------|------|-----------------------|
| income    | .0551638 | .0057859  | 9.53 | 0.000 | .0438236   .066504 |
| hsgpa     | 1.111672 | .1407083  | 7.90 | 0.000 | .8358891   1.387456 |
| _cons     | -.8180699 | .4032468  | -2.03 | 0.042 | -1.608419  -.0277207|
| hsgpa     | income  | .0356351 | .0019553 | 18.22 | 0.000 | .0318027   .0394675 |
| hsgpa     | moderate| -.1317151 | .0136277 | -9.67 | 0.000 | -.1584249  -.1050052 |
| hsgpa     | high    | -.2320803 | .0233633 | -9.93 | 0.000 | -.2778715  -.186289 |
| hsgpa     | _cons   | 2.951568 | .0164465 | 179.46 | 0.000 | 2.919333  2.983802 |

```
We again find that unobservable factors that increase high school GPA tend to increase college GPA. The parameter estimates here are interpreted just as we did in [ERM] Example 1a. In that example, the estimated coefficient on hsgpa was 1.24; here it is 1.11. Like the relationship between regress and intreg, the 1.24 and 1.11 estimate the same parameter, the relationship between hsgpa and the uncensored outcome.

We will not further interpret this model here. Instead we refer you to the interpretation in [ERM] Example 1a. The interval censoring of the dependent variable demonstrated here makes no difference in what commands you would type to answer questions or in how you would interpret the results of those commands. In fact, we encourage you to run the commands discussed in [ERM] Example 1a on this model and compare the results.

Because interval regression is a generalization of tobit regression, you can also use eintreg to fit a tobit model with endogenous selection. However, you must convert your dependent variable into interval form. We illustrate how to do this in [ERM] Intro 8.
