estat lcprob — Latent class marginal probabilities

Description

estat lcprob reports a table of the marginal predicted latent class probabilities.

Menu for estat

Statistics > Postestimation

Syntax

estat lcprob [, options]

options Description

classpr latent class probability; the default
classposteriorpr posterior latent class probability
nose do not estimate SEs
post post margins and their VCE as estimation results
display_options control column formats, row spacing, and line width

Options

classpr, the default, calculates marginal predicted probabilities for each latent class.
classposteriorpr calculates marginal predicted posterior probabilities for each latent class. The posterior probabilities are a function of the latent-class predictors and the fitted outcome densities.
nose suppresses calculation of the VCE and standard errors.

post causes estat lcprob to behave like a Stata estimation (e-class) command. estat lcprob posts the vector of estimated margins along with the estimated variance–covariance matrix to e(), so you can treat the estimated margins just as you would results from any other estimation command.

display_options: vsquish, fvwrap(#), fvwrappon(style), cformat(%fmt), pformat(%fmt), sformat(%fmt), and nolstretch.

Remarks and examples

estat lcprob is illustrated in [FMM] Example 1a, [FMM] Example 2, and [FMM] Example 3.
Stored results

`estat lcprob` stores the following in `r()`:

Scalars
- `r(N)` number of observations

Macros
- `r(title)` title in output

Matrices
- `r(b)` estimates
- `r(V)` variance–covariance matrix of the estimates
- `r(table)` matrix containing the margins with their standard errors, test statistics, $p$-values, and confidence intervals

`estat lcprob` with the `post` option also stores the following in `e()`:

Scalars
- `e(N)` number of observations

Macros
- `e(title)` title in output
- `e(classposteriorpr)` `classposteriorpr` or empty
- `e(properties)` `b V`

Matrices
- `e(b)` estimates
- `e(V)` variance–covariance matrix of the estimates
