</tbody>
</table>
### String functions

- **strproper(s)**: a string with the first ASCII letter and any other letters immediately following characters that are not letters capitalized; all other ASCII letters converted to lowercase.
- **strreverse(s)**: reverses the ASCII string s.
- **strrpos(s_1,s_2)**: the position in s_1 at which s_2 is last found, 0 if s_2 does not occur, and 1 if s_2 is empty.
- **strtrim(s)**: s without trailing blanks (ASCII space character char(32)).
- **strtoname(s,p)**: s translated into a Stata 13 compatible name.
- **strtrim(s)**: s without leading and trailing blanks (ASCII space character char(32)); equivalent to strltrim(strrtrim(s)).
- **strupper(s)**: uppercase ASCII characters in string s.
- **subinstr(s_1,s_2,s_3,n)**: s_1, where the first n occurrences in s_1 of s_2 have been replaced with s_3.
- **subinword(s_1,s_2,s_3,n)**: s_1, where the first n occurrences in s_1 of s_2 as a word have been replaced with s_3.
- **substr(s,n_1,n_2)**: the substring of s, starting at n_1, for a length of n_2.
- **tobytes(s[,n])**: escaped decimal or hex digit strings of up to 200 bytes of s.
- **uchar(n)**: the Unicode character corresponding to Unicode code point n or an empty string if n is beyond the Unicode code-point range.
- **udstrlen(s)**: the number of display columns needed to display the Unicode string s in the Stata Results window.
- **udsubstr(s,n_1,n_2)**: the Unicode substring of s, starting at character n_1, for n_2 display columns.
- **uisdigit(s)**: 1 if the first Unicode character in s is a Unicode decimal digit; otherwise, 0.
- **uisletter(s)**: 1 if the first Unicode character in s is a Unicode letter; otherwise, 0.
- **ustrcompare(s_1,s_2[,loc])**: compares two Unicode strings.
- **ustrcompareex(s_1,s_2,loc,case,cslv,norm,nu,m,al,t,fr)**: compares two Unicode strings.
- **ustrfix(s[,rep])**: replaces each invalid UTF-8 sequence with a Unicode character.
- **ustrfrom(s,enc,mode)**: converts the string s in encoding enc to a UTF-8 encoded Unicode string.
- **ustrinvalidcnt(s)**: the number of invalid UTF-8 sequences in s.
- **ustrleft(s,n)**: the first n Unicode characters of the Unicode string s.
- **ustrlen(s)**: the number of characters in the Unicode string s.
- **ustrlower(s[,loc])**: lowercase all characters of Unicode string s under the given locale loc.
- **ustrltrim(s)**: removes the leading Unicode whitespace characters and blanks from the Unicode string s.
- **ustrnormalize(s,norm)**: normalizes Unicode string s to one of the five normalization forms specified by norm.
- **ustrpos(s_1,s_2[,n])**: the position in s_1 at which s_2 is first found; otherwise, 0.
- **ustrregexm(s,reg[,noc])**: performs a match of a regular expression and evaluates to 1 if regular expression reg is satisfied by the Unicode string s; otherwise, 0.
- **ustrregexra(s_1,reg,s_2[,noc])**: replaces all substrings within the Unicode string s_1 that match reg with s_2 and returns the resulting string.
ustrregexrf(s1, re, s2[, noc]) replaces the first substring within the Unicode string s1 that matches re with s2 and returns the resulting string

ustrregexs(n) subexpression n from a previous ustrregexm() match

ustrreverse(s) reverses the Unicode string s

ustrright(s, n) the last n Unicode characters of the Unicode string s

ustrrpos(s1, s2[, n]) the position in s1 at which s2 is last found; otherwise, 0

ustrrtrim(s) remove trailing Unicode whitespace characters and blanks from the Unicode string s

ustrsortkey(s[, loc]) generates a null-terminated byte array that can be used by the sort command to produce the same order as ustrcompare()

ustrsortkeyex(s, loc, st, case, cslv, norm, num, alt, fr) generates a null-terminated byte array that can be used by the sort command to produce the same order as ustrcompare()

ustrtitle(s[, loc]) a string with the first characters of Unicode words titlecased and other characters lowercased

ustrto(s, enc, mode) converts the Unicode string s in UTF-8 encoding to a string in encoding enc

ustrtohex(s[, n]) escaped hex digit string of s up to 200 Unicode characters

ustrtoname(s[, p]) string s translated into a Stata name

ustrtrim(s) removes leading and trailing Unicode whitespace characters and blanks from the Unicode string s

ustrunescape(s) the Unicode string corresponding to the escaped sequences of s

ustrupper(s[, loc]) uppercase all characters in string s under the given locale loc

ustrword(s, n[, loc]) the nth Unicode word in the Unicode string s

ustrwordcount(s[, loc]) the number of nonempty Unicode words in the Unicode string s

usubinstr(s1, s2, s3, n) replaces the first n occurrences of the Unicode string s2 with the Unicode string s3 in s1

usubstr(s, n1, n2) the Unicode substring of s, starting at n1, for a length of n2

word(s, n) the nth word in s; missing (""") if n is missing

wordbreaklocale(loc, type) the most closely related locale supported by ICU from loc if type is 1, the actual locale where the word-boundary analysis data come from if type is 2; or an empty string is returned for any other type

wordcount(s) the number of words in s

Functions

In the display below, s indicates a string subexpression (a string literal, a string variable, or another string expression) and n indicates a numeric subexpression (a number, a numeric variable, or another numeric expression).

If your strings contain Unicode characters or you are writing programs that will be used by others who might use Unicode strings, read [U] 12.4.2 Handling Unicode strings.
String functions

abbrev(s, n)
Description: name s, abbreviated to a length of n

Length is measured in the number of display columns, not in the number of characters. For most users, the number of display columns equals the number of characters. For a detailed discussion of display columns, see [U] 12.4.2.2 Displaying Unicode characters.

If any of the characters of s are a period, “.”, and n < 8, then the value of n defaults to a value of 8. Otherwise, if n < 5, then n defaults to a value of 5. If n is missing, abbrev() will return the entire string s. abbrev() is typically used with variable names and variable names with factor-variable or time-series operators (the period case).

abbrev("displacement",8) is displa-t.

Domain s: strings
Domain n: integers 5 to 32
Range: strings

char(n)
Description: the character corresponding to ASCII or extended ASCII code n; "" if n is not in the domain

Note: ASCII codes are from 0 to 127; extended ASCII codes are from 128 to 255. Prior to Stata 14, the display of extended ASCII characters was encoding dependent. For example, char(128) on Microsoft Windows using Windows-1252 encoding displayed the Euro symbol, but on Linux using ISO-Latin-1 encoding, char(128) displayed an invalid character symbol. Beginning with Stata 14, Stata’s display encoding is UTF-8 on all platforms. The char(128) function is an invalid UTF-8 sequence and thus will display a question mark. There are two Unicode functions corresponding to char(): uchar() and ustrunescape(). You can use uchar(8364) or ustrunescape("\u20AC") to display a Euro sign on all platforms.

Domain n: integers 0 to 255
Range: ASCII characters

uchar(n)
Description: the Unicode character corresponding to Unicode code point n or an empty string if n is beyond the Unicode code-point range

Note that uchar() takes the decimal value of the Unicode code point. ustrunescape() takes an escaped hex digit string of the Unicode code point. For example, both uchar(8364) and ustrunescape("\u20ac") produce the Euro sign.

Domain n: integers ≥ 0
Range: Unicode characters
collatorlocale(loc, type)
Description: the most closely related locale supported by ICU from loc if type is 1; the actual
locale where the collation data comes from if type is 2

For any other type, loc is returned in a canonicalized form.

collatorlocale("en_us_texas", 0) = en_US_TEXAS
collatorlocale("en_us_texas", 1) = en_US
collatorlocale("en_us_texas", 2) = root

Domain loc: strings of locale name
Domain type: integers
Range: strings

collatorversion(loc)
Description: the version string of a collator based on locale loc

The Unicode standard is constantly adding more characters and the sort key format
may change as well. This can cause ustrsortkey() and ustrsortkeyex() to produce incompatible sort keys between different versions of International
Components for Unicode. The version string can be used for versioning the sort
keys to indicate when saved sort keys must be regenerated.

Range: strings

indexnot(s1, s2)
Description: the position in ASCII string s1 of the first character of s1 not found in ASCII string
s2, or 0 if all characters of s1 are found in s2

indexnot() is intended for use with only plain ASCII strings. For Unicode
characters beyond the plain ASCII range, the position and character are given in
bytes, not characters.

Domain s1: ASCII strings (to be searched)
Domain s2: ASCII strings (to search for)
Range: integers ≥ 0

plural(n, s)
Description: the plural of s if n ≠ ±1

The plural is formed by adding “s” to s.

plural(1, "horse") = "horse"
plural(2, "horse") = "horses"

Domain n: real numbers
Domain s: strings
Range: strings
plural(n, s1, s2)
Description: the plural of s1, as modified by or replaced with s2, if n ≠ ±1

If s2 begins with the character “+”, the plural is formed by adding the remainder of s2 to s1. If s2 begins with the character “-”, the plural is formed by subtracting the remainder of s2 from s1. If s2 begins with neither “+” nor “-”, then the plural is formed by returning s2.

plural(2, "glass", "+es") = "glasses"
plural(1, "mouse", "mice") = "mouse"
plural(2, "mouse", "mice") = "mice"
plural(2, "abcdefg", "-efg") = "abcd"

Domain n: real numbers
Domain s1: strings
Domain s2: strings
Range: strings

real(s)
Description: s converted to numeric or missing

Also see strofreal().
real("5.2") + 1 = 6.2
real("hello") = .

Domain s: strings
Range: −8e+307 to 8e+307 or missing

regexm(s, re)
Description: performs a match of a regular expression and evaluates to 1 if regular expression re is satisfied by the ASCII string s; otherwise, 0

Regular expression syntax is based on Henry Spencer’s NFA algorithm, and this is nearly identical to the POSIX.2 standard. s and re may not contain binary 0 (\0).

regexm() is intended for use with only plain ASCII characters. For Unicode characters beyond the plain ASCII range, the match is based on bytes. For a character-based match, see ustrregexm().

Domain s: ASCII strings
Domain re: regular expressions
Range: ASCII strings
regexr\(s_1, re, s_2\)
Description: replaces the first substring within ASCII string \(s_1\) that matches \(re\) with ASCII string \(s_2\) and returns the resulting string.

If \(s_1\) contains no substring that matches \(re\), the unaltered \(s_1\) is returned. \(s_1\) and the result of \(regexr()\) may be at most 1,100,000 characters long. \(s_1, re,\) and \(s_2\) may not contain binary 0 (\(\0\)).

\(regexr()\) is intended for use with only plain ASCII characters. For Unicode characters beyond the plain ASCII range, the match is based on bytes and the result is restricted to 1,100,000 bytes. For a character-based match, see \(ustrregexrf()\) or \(ustrregexra()\).

Domain \(s_1\): ASCII strings
Domain \(re\): regular expressions
Domain \(s_2\): ASCII strings
Range: ASCII strings

regexs\((n)\)
Description: subexpression \(n\) from a previous \(regexm()\) match, where \(0 \leq n < 10\)

Subexpression 0 is reserved for the entire string that satisfied the regular expression. The returned subexpression may be at most 1,100,000 characters (bytes) long.

Domain \(n\): 0 to 9
Range: ASCII strings

ustrregexm\((s, re[, noc])\)
Description: performs a match of a regular expression and evaluates to 1 if regular expression \(re\) is satisfied by the Unicode string \(s\); otherwise, 0.

If \(noc\) is specified and not 0, a case-insensitive match is performed. The function may return a negative integer if an error occurs.

\[
\text{ustrregexm("12345", "([0-9]{5})") = 1}
\]
\[
\text{ustrregexm("de TRÈS près", "rè$\) = 1}
\]
\[
\text{ustrregexm("de TRÈS près", "Rè$\) = 0}
\]
\[
\text{ustrregexm("de TRÈS près", "Rè$, 1) = 1}
\]

Domain \(s\): Unicode strings
Domain \(re\): Unicode regular expressions
Domain \(noc\): integers
Range: integers
ustrregexrf($s_1, re, s_2[, noc])
Description: replaces the first substring within the Unicode string $s_1$ that matches $re$ with $s_2$ and returns the resulting string
If $noc$ is specified and not 0, a case-insensitive match is performed. The function may return an empty string if an error occurs.

ustrregexrf("très près", "rés", "X") = "tX près"
ustrregexrf("TRÈS près", "Rès", "X") = "TRÈS près"
ustrregexrf("TRÈS près", "Rès", "X", 1) = "TX près"

Domain $s_1$: Unicode strings
Domain $re$: Unicode regular expressions
Domain $s_2$: Unicode strings
Domain $noc$: integers
Range: Unicode strings

ustrregexra($s_1, re, s_2[, noc])
Description: replaces all substrings within the Unicode string $s_1$ that match $re$ with $s_2$ and returns the resulting string
If $noc$ is specified and not 0, a case-insensitive match is performed. The function may return an empty string if an error occurs.

ustrregexra("très près", "rés", "X") = "tX pX"
ustrregexra("TRÈS près", "Rès", "X") = "TRÈS près"
ustrregexra("TRÈS près", "Rès", "X", 1) = "TX pX"

Domain $s_1$: Unicode strings
Domain $re$: Unicode regular expressions
Domain $s_2$: Unicode strings
Domain $noc$: integers
Range: Unicode strings

ustrregexs($n$)
Description: subexpression $n$ from a previous ustrregexm() match
Subexpression 0 is reserved for the entire string that satisfied the regular expression. The function may return an empty string if $n$ is larger than the maximum count of subexpressions from the previous match or if an error occurs.

Domain $n$: integers $\geq 0$
Range: strings
soundex(s)
Description: the soundex code for a string, s
The soundex code consists of a letter followed by three numbers: the letter is the first ASCII letter of the name and the numbers encode the remaining consonants. Similar sounding consonants are encoded by the same number. Unicode characters beyond the plain ASCII range are ignored.

\[
soundex("Ashcraft") = "A226"
\]
\[
soundex("Robert") = "R163"
\]
\[
soundex("Rupert") = "R163"
\]
Domain s: strings
Range: strings

soundex_nara(s)
Description: the U.S. Census soundex code for a string, s
The soundex code consists of a letter followed by three numbers: the letter is the first ASCII letter of the name and the numbers encode the remaining consonants. Similar sounding consonants are encoded by the same number. Unicode characters beyond the plain ASCII range are ignored.

\[
soundex_nara("Ashcraft") = "A261"
\]
Domain s: strings
Range: strings

strcat(s_1, s_2)
Description: there is no strcat() function; instead the addition operator is used to concatenate strings

\[
"hello " + "world" = "hello world"
\]
\[
"a" + "b" = "ab"
\]
\[
"Caf´ e " + "de Flore" = "Caf´ e de Flore"
\]
Domain s_1: strings
Domain s_2: strings
Range: strings

strdup(s_1, n)
Description: there is no strdup() function; instead the multiplication operator is used to create multiple copies of strings

\[
"hello" * 3 = "hellohellohello"
\]
\[
3 * "hello" = "hellohellohello"
\]
\[
0 * "hello" = ""
\]
\[
"hello" * 1 = "hello"
\]
\[
"Здравствуйте " * 2 = "Здравствуйте Здравствуйте"
\]
Domain s_1: strings
Domain n: nonnegative integers 0, 1, 2, ...
Range: strings
**string(n)**
Description: a synonym for strofreal(n)

**string(n,s)**
Description: a synonym for strofreal(n,s)

**strtrim(s)**
Description: `s` with multiple, consecutive internal blanks (ASCII space character `char(32)`) collapsed to one blank

\[
\text{strtrim("hello there") } = \text{"hello there"}
\]

Domain `s`: strings
Range: strings with no multiple, consecutive internal blanks

**strlen(s)**
Description: the number of characters in ASCII `s` or length in bytes

`strlen()` is intended for use with only plain ASCII characters and for use by programmers who want to obtain the byte-length of a string. Note that any Unicode character beyond ASCII range (code point greater than 127) takes more than 1 byte in the UTF-8 encoding; for example, é takes 2 bytes.

For the number of characters in a Unicode string, see `ustrlen()`.

\[
\text{strlen("ab") } = 2 \\
\text{strlen("é") } = 2
\]

Domain `s`: strings
Range: integers ≥ 0

**ustrlen(s)**
Description: the number of characters in the Unicode string `s`

An invalid UTF-8 sequence is counted as one Unicode character. An invalid UTF-8 sequence may contain one byte or multiple bytes. Note that any Unicode character beyond the plain ASCII range (code point greater than 127) takes more than 1 byte in the UTF-8 encoding; for example, é takes 2 bytes.

\[
\text{ustrlen("médiante") } = 7 \\
\text{strlen("médiante") } = 8
\]

Domain `s`: Unicode strings
Range: integers ≥ 0
**udstrlen(s)**

Description: the number of display columns needed to display the Unicode string \( s \) in the Stata Results window

A Unicode character in the CJK (Chinese, Japanese, and Korean) encoding usually requires two display columns; a Latin character usually requires one column. Any invalid UTF-8 sequence requires one column.

\[
\text{udstrlen("中值") = 4}
\]
\[
\text{ustrlen("中值") = 2}
\]
\[
\text{strlen("中值") = 6}
\]

Domain \( s \): Unicode strings

Range: integers \( \geq 0 \)

**strlower(s)**

Description: lowercase ASCII characters in string \( s \)

Unicode characters beyond the plain ASCII range are ignored.

\[
\text{strlower("THIS") = "this"}
\]
\[
\text{strlower("CAFÉ") = "cafÊ"}
\]

Domain \( s \): strings

Range: strings with lowercased characters

**ustrlower(s[,loc])**

Description: lowercase all characters of Unicode string \( s \) under the given locale \( loc \)

If \( loc \) is not specified, the default locale is used. The same \( s \) but different \( loc \) may produce different results; for example, the lowercase letter of “I” is “i” in English but a dotless “i” in Turkish. The same Unicode character can be mapped to different Unicode characters based on its surrounding characters; for example, Greek capital letter sigma \( \Sigma \) has two lowercases: \( \varsigma \), if it is the final character of a word, or \( \sigma \). The result can be longer or shorter than the input Unicode string in bytes.

\[
\text{ustrlower("MÉDIANE","fr") = "médiane"}
\]
\[
\text{ustrlower("İSTANBUL","tr") = "istanbul"}
\]
\[
\text{ustrlower("ΟΔΥΣΕΕΥΣ") = "δύσεψυς"}
\]

Domain \( s \): Unicode strings

Domain \( loc \): locale name

Range: Unicode strings

**strltrim(s)**

Description: \( s \) without leading blanks (ASCII space character \text{char(32)}\)

\[
\text{strltrim(" this") = "this"}
\]

Domain \( s \): strings

Range: strings without leading blanks
ustrltrim($x$)
Description: removes the leading Unicode whitespace characters and blanks from the Unicode string $s$

Note that, in addition to char(32), ASCII characters char(9), char(10), char(11), char(12), and char(13) are whitespace characters in Unicode standard.

ustrltrim(" this") = "this"
ustrltrim(char(9)+"this") = "this"
ustrltrim(ustrunescape("\u1680")+" this") = "this"

Domain $s$: Unicode strings
Range: Unicode strings

strmatch($s_1$, $s_2$)
Description: 1 if $s_1$ matches the pattern $s_2$; otherwise, 0

strmatch("17.4","1??4") returns 1. In $s_2$, "?" means that one character goes here, and "*" means that zero or more bytes go here. Note that a Unicode character may contain multiple bytes; thus, using "*" with Unicode characters can infrequently result in matches that do not occur at a character boundary.

Also see regexm(), regexr(), and regexs().

strmatch("café", "caf?") = 1

Domain $s_1$: strings
Domain $s_2$: strings
Range: integers 0 or 1

strofreal($n$)
Description: $n$ converted to a string

Also see real().

strofreal(4)+"F" = "4F"
strofreal(1234567) = "1234567"
strofreal(12345678) = "1.23e+07"
strofreal(.) = "."

Domain $n$: −8e+307 to 8e+307 or missing
Range: strings
strofreal(n, s)
Description: \( n \) converted to a string using the specified display format

Also see real().

\[
\begin{align*}
strofreal(4, "\%9.2f") &= "4.00" \\
strofreal(123456789, "\%11.0g") &= "123456789" \\
strofreal(123456789, "\%13.0gc") &= "123,456,789" \\
strofreal(0, "\%td") &= "01jan1960" \\
strofreal(225, "\%tq") &= "2016q2" \\
strofreal(225, "not a format") &= ""
\end{align*}
\]

Domain \( n \): \(-8e+307 \) to \( 8e+307 \) or missing

Domain \( s \): strings containing \%fmt numeric display format

Range: strings

strpos(s1, s2)
Description: the position in \( s_1 \) at which \( s_2 \) is first found, 0 if \( s_2 \) does not occur, and 1 if \( s_2 \) is empty

\( \text{strpos()} \) is intended for use with only plain ASCII characters and for use by programmers who want to obtain the byte-position of \( s_2 \). Note that any Unicode character beyond ASCII range (code point greater than 127) takes more than 1 byte in the UTF-8 encoding; for example, é takes 2 bytes.

To find the character position of \( s_2 \) in a Unicode string, see ustrpos().

\[
\begin{align*}
\text{strpos("this", "is")} &= 3 \\
\text{strpos("this", "it")} &= 0 \\
\text{strpos("this", "")} &= 1
\end{align*}
\]

Domain \( s_1 \): strings (to be searched)

Domain \( s_2 \): strings (to search for)

Range: integers \( \geq 0 \)

ustrpos(s1, s2[, n])
Description: the position in \( s_1 \) at which \( s_2 \) is first found; otherwise, 0

If \( n \) is specified and is greater than 0, the search starts at the \( n \)th Unicode character of \( s_1 \). An invalid UTF-8 sequence in either \( s_1 \) or \( s_2 \) is replaced with a Unicode replacement character \ufffd before the search is performed.

\[
\begin{align*}
\text{ustrpos("médiaine", "édi")} &= 2 \\
\text{ustrpos("médiaine", "édi", 3)} &= 0 \\
\text{ustrpos("médiaine", "éci")} &= 0
\end{align*}
\]

Domain \( s_1 \): Unicode strings (to be searched)

Domain \( s_2 \): Unicode strings (to search for)

Domain \( n \): integers

Range: integers
strproper(s)
Description: a string with the first ASCII letter and any other letters immediately following characters that are not letters capitalized; all other ASCII letters converted to lowercase

strproper() implements a form of *titlecasing* and is intended for use with only plain ASCII strings. Unicode characters beyond ASCII are treated as characters that are not letters. To titlecase strings with Unicode characters beyond the plain ASCII range or to implement language-sensitive rules for titlecasing, see *ustrtitle()*. 

\[
\begin{align*}
\text{strproper("mR. joHn a. sMitH") } &= \text{"Mr. John A. Smith"} \\
\text{strproper("jack o’reilly") } &= \text{"Jack O’Reilly"} \\
\text{strproper("2-cent’s worth") } &= \text{"2-Cent’S Worth"} \\
\text{strproper("vous êtes") } &= \text{"Vous êtes"}
\end{align*}
\]

*Domain s:* strings
*Range:* strings

ustrtitle(s[,loc])
Description: a string with the first characters of Unicode words titlecased and other characters lowercased

If *loc* is not specified, the default locale is used. Note that a Unicode word is different from a Stata word produced by function *word()*. The Stata word is a space-separated token. A Unicode word is a language unit based on either a set of word-boundary rules or dictionaries for some languages (Chinese, Japanese, and Thai). The titlecase is also locale dependent and context sensitive; for example, lowercase “ij” is considered a digraph in Dutch. Its titlecase is “IJ”.

\[
\begin{align*}
\text{ustrtitle("vous êtes", "fr") } &= \text{"Vous Étes"} \\
\text{ustrtitle("mR. joHn a. sMitH") } &= \text{"Mr. John A. Smith"} \\
\text{ustrtitle("ijmuiden", "en") } &= \text{"Ijmuiden"} \\
\text{ustrtitle("ijmuiden", "nl") } &= \text{"IJmuiden"}
\end{align*}
\]

*Domain s:* Unicode strings
*Domain loc:* Unicode strings
*Range:* Unicode strings

strreverse(s)
Description: reverses the ASCII string *s*

*strreverse()* is intended for use with only plain ASCII characters. For Unicode characters beyond ASCII range (code point greater than 127), the encoded bytes are reversed.

To reverse the characters of Unicode string, see *ustrreverse()*. 

\[
\begin{align*}
\text{strreverse("hello") } &= \text{"olleh"}
\end{align*}
\]

*Domain s:* ASCII strings
*Range:* ASCII reversed strings
ustrreverse($s$)
Description: reverses the Unicode string $s$

The function does not take Unicode character equivalence into consideration. Hence, a Unicode character in a decomposed form will not be reversed as one unit. An invalid UTF-8 sequence is replaced with a Unicode replacement character \ufffd.

`ustrreverse("médiane") = "enaidém"`

Domain $s$: Unicode strings
Range: reversed Unicode strings

strrpos($s_1$, $s_2$)
Description: the position in $s_1$ at which $s_2$ is last found, 0 if $s_2$ does not occur, and 1 if $s_2$ is empty

`strrpos()` is intended for use with only plain ASCII characters and for use by programmers who want to obtain the last byte-position of $s_2$. Note that any Unicode character beyond ASCII range (code point greater than 127) takes more than 1 byte in the UTF-8 encoding; for example, é takes 2 bytes.

To find the last character position of $s_2$ in a Unicode string, see `ustrrpos()`.

`strrpos("this","is") = 3`
`strrpos("this","is") = 6`
`strrpos("this","it") = 0`
`strrpos("this","") = 1`

Domain $s_1$: strings (to be searched)
Domain $s_2$: strings (to search for)
Range: integers $\geq 0$

ustrrpos($s_1$, $s_2$[, $n$])
Description: the position in $s_1$ at which $s_2$ is last found; otherwise, 0

If $n$ is specified and is greater than 0, only the part between the first Unicode character and the $n$th Unicode character of $s_1$ is searched. An invalid UTF-8 sequence in either $s_1$ or $s_2$ is replaced with a Unicode replacement character \ufffd before the search is performed.

`ustrrpos("enchanté","n") = 6`
`ustrrpos("enchanté","n", 5) = 2`
`ustrrpos("enchanté","n", 6) = 6`
`ustrrpos("enchanté","ne") = 0`

Domain $s_2$: Unicode strings (to search for)
Domain $n$: integers
Range: integers

strrtrim($s$)
Description: $s$ without trailing blanks (ASCII space character `char(32)`)

`strrtrim("this ") = "this"`

Domain $s$: strings
Range: strings without trailing blanks
ustrtrim(s)
Description: remove trailing Unicode whitespace characters and blanks from the Unicode string s
Note that, in addition to char(32), ASCII characters char(9), char(10), char(11), char(12), and char(13) are considered whitespace characters in the Unicode standard.
ustrtrim("this ") = "this"
ustrtrim("this"+char(10)) = "this"
ustrtrim("this "+ustrunescape("\u2000")) = "this"
Domain s: Unicode strings
Range: Unicode strings

strtoname(s[,p])
Description: s translated into a Stata 13 compatible name
strtoname() results in a name that is truncated to 32 bytes. Each character in s that is not allowed in a Stata name is converted to an underscore character, _. If the first character in s is a numeric character and p is not 0, then the result is prefixed with an underscore. Stata 14 names may be 32 characters; see [U] 11.3 Naming conventions.
strtoname("name") = "name"
strtoname("a name") = "a_name"
strtoname("5",1) = "_5"
strtoname("5:30",1) = "_5_30"
strtoname("5",0) = "5"
strtoname("5:30",0) = "5_30"
Domain s: strings
Domain p: integers 0 or 1
Range: strings

ustrtoname(s[,p])
Description: string s translated into a Stata name
ustrtoname() results in a name that is truncated to 32 characters. Each character in s that is not allowed in a Stata name is converted to an underscore character, _. If the first character in s is a numeric character and p is not 0, then the result is prefixed with an underscore.
ustrtoname("name",1) = "name"
ustrtoname("the médiiane") = "the_médiiane"
ustrtoname("0médiane") = "_0médiane"
ustrtoname("0médiane",1) = "_0médiane"
ustrtoname("0médiane",0) = "0médiane"
Domain s: Unicode strings
Domain p: integers 0 or 1
Range: Unicode strings
**strtrim(s)**

Description: $s$ without leading and trailing blanks (ASCII space character \texttt{char(32)}); equivalent to \texttt{strltrim(strrtrim(s))}

\[
\text{strtrim(" this ") = "this"}
\]

Domain $s$: strings

Range: strings without leading or trailing blanks

**ustrtrim(s)**

Description: removes leading and trailing Unicode whitespace characters and blanks from the Unicode string $s$

Note that, in addition to \texttt{char(32)}, ASCII characters \texttt{char(9)}, \texttt{char(10)}, \texttt{char(11)}, \texttt{char(12)}, and \texttt{char(13)} are considered whitespace characters in the Unicode standard.

\[
\text{ustrtrim(" this ") = "this"}
\text{ustrtrim(char(11)+" this ")+char(13) = "this"}
\text{ustrtrim(" this "+ustrunescape("\u2000")) = "this"}
\]

Domain $s$: Unicode strings

Range: Unicode strings

**strupper(s)**

Description: uppercase ASCII characters in string $s$

Unicode characters beyond the plain ASCII range are ignored.

\[
\text{strupper("this") = "THIS"}
\text{strupper("café") = "CAFé"}
\]

Domain $s$: strings

Range: strings with.uppercased characters

**ustrupper(s[,loc])**

Description: uppercase all characters in string $s$ under the given locale $loc$

If $loc$ is not specified, the default locale is used. The same $s$ but a different $loc$ may produce different results; for example, the uppercase letter of “i” is “I” in English, but “İ” with a dot in Turkish. The result can be longer or shorter than the input string in bytes; for example, the uppercase form of the German letter ß (code point \texttt{\u00df}) is two capital letters “SS”.

\[
\text{ustrupper("médiane","fr") = "MÉDIANE"}
\text{ustrupper("Rüßland", "de") = "RUSSLAND"}
\text{ustrupper("ıstanbul", "tr") = "İSTANBUL"}
\]

Domain $s$: Unicode strings

Domain $loc$: locale name

Range: Unicode strings
subinstr(s₁, s₂, s₃, n)

Description: \( s₁ \), where the first \( n \) occurrences in \( s₁ \) of \( s₂ \) have been replaced with \( s₃ \)

subinstr() is intended for use with only plain ASCII characters and for use by programmers who want to perform byte-based substitution. Note that any Unicode character beyond ASCII range (code point greater than 127) takes more than 1 byte in the UTF-8 encoding; for example, é takes 2 bytes.

To perform character-based replacement in Unicode strings, see usubinstr().

If \( n \) is missing, all occurrences are replaced.

Also see regexm(), regexr(), and regexs().

\[
\begin{align*}
\text{subinstr("this is the day","is","X",1) = "thX is the day"} \\
\text{subinstr("this is the hour","is","X",2) = "thX X the hour"} \\
\text{subinstr("this is this","is","X",.) = "thX X thX"}
\end{align*}
\]

Domain \( s₁: \) strings (to be substituted into)
Domain \( s₂: \) strings (to be substituted from)
Domain \( s₃: \) strings (to be substituted with)
Domain \( n: \) integers ≥ 0 or missing
Range: strings

usubinstr(s₁, s₂, s₃, n)

Description: replaces the first \( n \) occurrences of the Unicode string \( s₂ \) with the Unicode string \( s₃ \) in \( s₁ \)

If \( n \) is missing, all occurrences are replaced. An invalid UTF-8 sequence in \( s₁, s₂, \) or \( s₃ \) is replaced with a Unicode replacement character \ufffd before replacement is performed.

\[
\begin{align*}
\text{usubinstr("de très près","ès","es",1) = "de tres près"} \\
\text{usubinstr("de très près","ès","X",2) = "de trX prX"}
\end{align*}
\]

Domain \( s₁: \) Unicode strings (to be substituted into)
Domain \( s₂: \) Unicode strings (to be substituted from)
Domain \( s₃: \) Unicode strings (to be substituted with)
Domain \( n: \) integers ≥ 0 or missing
Range: Unicode strings
**subinword**(s₁, s₂, s₃, n)

**Description:** s₁, where the first n occurrences in s₁ of s₂ as a word have been replaced with s₃

A word is defined as a space-separated token. A token at the beginning or end of s₁ is considered space-separated. This is different from a Unicode word, which is a language unit based on either a set of word-boundary rules or dictionaries for several languages (Chinese, Japanese, and Thai). If n is missing, all occurrences are replaced.

Also see **regem()**, **regexr()**, and **regexs()**.

**subinword**("this is the day","is","X",1) = "this X the day"
**subinword**("this is the hour","is","X",.) = "this X the hour"
**subinword**("this is this","th","X",.) = "this is this"

**Domain s₁:** strings (to be substituted for)
**Domain s₂:** strings (to be substituted from)
**Domain s₃:** strings (to be substituted with)
**Domain n:** integers ≥ 0 or missing
**Range:** strings

**substr**(s, n₁, n₂)

**Description:** the substring of s, starting at n₁, for a length of n₂

**substr()** is intended for use with only plain ASCII characters and for use by programmers who want to extract a subset of bytes from a string. For those with plain ASCII text, n₁ is the starting character, and n₂ is the length of the string in characters. For programmers, **substr()** is technically a byte-based function. For plain ASCII characters, the two are equivalent but you can operate on byte values beyond that range. Note that any Unicode character beyond ASCII range (code point greater than 127) takes more than 1 byte in the UTF-8 encoding; for example, é takes 2 bytes.

To obtain substrings of Unicode strings, see **usubstr()**.

If n₁ < 0, n₁ is interpreted as the distance from the end of the string; if n₂ = . (missing), the remaining portion of the string is returned.

**substr**("abcdef",2,3) = "bcd"
**substr**("abcdef",-3,2) = "de"
**substr**("abcdef",2,.) = "bcdef"
**substr**("abcdef",-3,.) = "def"
**substr**("abcdef",2,0) = ""
**substr**("abcdef",15,2) = ""

**Domain s:** strings
**Domain n₁:** integers ≥ 1 and ≤ -1
**Domain n₂:** integers ≥ 1
**Range:** strings
usubstr\((s, n_1, n_2)\)

Description: the Unicode substring of \(s\), starting at \(n_1\), for a length of \(n_2\)

- If \(n_1 < 0\), \(n_1\) is interpreted as the distance from the last character of the \(s\); if \(n_2 = .\) (missing), the remaining portion of the Unicode string is returned.

\[
\begin{align*}
\text{usubstr}\("\text{m'ediane}" , 2, 3) &= "\text{edi}" \\
\text{usubstr}\("\text{m'ediane}" , -3, 2) &= "\text{an}" \\
\text{usubstr}\("\text{m'ediane}" , 2, .) &= "\text{ediane}" 
\end{align*}
\]

Range: Unicode strings

udsubstr\((s, n_1, n_2)\)

Description: the Unicode substring of \(s\), starting at character \(n_1\), for \(n_2\) display columns

- If \(n_2 = .\) (missing), the remaining portion of the Unicode string is returned. If \(n_2\) display columns from \(n_1\) is in the middle of a Unicode character, the substring stops at the previous Unicode character.

\[
\begin{align*}
\text{udsubstr}\("\text{m'ediane}" , 2, 3) &= "\text{edi}" \\
\text{udsubstr}\("\text{中值}" , 1, 1) &= "" \\
\text{udsubstr}\("\text{中值}" , 1, 2) &= "\text{中}" 
\end{align*}
\]

Domain \(s\): Unicode strings
Domain \(n_1\): integers \(\geq 1\)
Domain \(n_2\): integers \(\geq 1\)
Range: Unicode strings

tobytes\([s, n]\) 

Description: escaped decimal or hex digit strings of up to 200 bytes of \(s\)

- The escaped decimal digit string is in the form of \(\text{\backslash dDDD}\). The escaped hex digit string is in the form of \(\text{\backslash xhh}\). If \(n\) is not specified or is 0, the decimal form is produced. Otherwise, the hex form is produced.

\[
\begin{align*}
\text{tobytes}\("\text{abc}" ) &= "\text{\backslash d097\backslash d098\backslash d099}\" \\
\text{tobytes}\("\text{abc}" , 1) &= "\text{\backslash x61\backslash x62\backslash x63}\" \\
\text{tobytes}\("\text{café}" ) &= "\text{\backslash d099\backslash d097\backslash d102\backslash d195\backslash d169}\" 
\end{align*}
\]

Domain \(s\): Unicode strings
Domain \(n\): integers
Range: strings

uisdigit\((s)\)

Description: 1 if the first Unicode character in \(s\) is a Unicode decimal digit; otherwise, 0

- A Unicode decimal digit is a Unicode character with the character property Nd according to the Unicode standard. The function returns \(-1\) if the string starts with an invalid UTF-8 sequence.

Domain \(s\): Unicode strings
Range: integers
uisletter(s)
Description: 1 if the first Unicode character in s is a Unicode letter; otherwise, 0
A Unicode letter is a Unicode character with the character property $L$ according to the Unicode standard. The function returns -1 if the string starts with an invalid UTF-8 sequence.
Domain $s$: Unicode strings
Range: integers

ustrcompare($s_1, s_2[, loc]$,)
Description: compares two Unicode strings
The function returns -1, 1, or 0 if $s_1$ is less than, greater than, or equal to $s_2$. The function may return a negative number other than -1 if an error happens. The comparison is locale dependent. For example, $z < ö$ in Swedish but $ö < z$ in German. If $loc$ is not specified, the default locale is used. The comparison is diacritic and case sensitive. If you need different behavior, for example, case-insensitive comparison, you should use the extended comparison function ustrcompareex(). Unicode string comparison compares Unicode strings in a language-sensitive manner. On the other hand, the sort command compares strings in code-point (binary) order. For example, uppercase “Z” (code-point value 90) comes before lowercase “a” (code-point value 97) in code-point order but comes after “a” in any English dictionary.

ustrcompare("z", "ö", "sv") = -1
ustrcompare("z", "ö", "de") = 1
Domain $s_1$: Unicode strings
Domain $s_2$: Unicode strings
Domain $loc$: Unicode strings
Range: integers

ustrcompareex($s_1, s_2, loc, st, case, cslv, norm, num, alt, fr$)
Description: compares two Unicode strings
The function returns -1, 1, or 0 if $s_1$ is less than, greater than, or equal to $s_2$. The function may return a negative number other than -1 if an error occurs. The comparison is locale dependent. For example, $z < ö$ in Swedish but $ö < z$ in German. If $loc$ is not specified, the default locale is used. $st$ controls the strength of the comparison. Possible values are 1 (primary), 2 (secondary), 3 (tertiary), 4 (quaternary), or 5 (identical). -1 means to use the default value for the locale. Any other numbers are treated as tertiary. The primary difference represents base letter differences; for example, letter “a” and letter “b” have primary differences. The secondary difference represents diacritical differences on the same base letter; for example, letters “a” and “ä” have secondary differences. The tertiary difference represents case differences of the same base letter; for example, letters “a” and “A” have tertiary differences. Quaternary strength is useful to distinguish between Katakana and Hiragana for the JIS 4061 collation standard. Identical strength is essentially the code-point order of the string, hence, is rarely useful.

ustrcompareex("café","cafe","fr", 1, -1, -1, -1, -1, -1, -1) = 0
ustrcompareex("café","cafe","fr", 2, -1, -1, -1, -1, -1, -1, -1) = 1
ustrcompareex("Café","café","fr", 3, -1, -1, -1, -1, -1, -1, -1) = 1
case controls the uppercase and lowercase letter order. Possible values are 0 (use order specified in tertiary strength), 1 (uppercase first), or 2 (lowercase first). -1 means to use the default value for the locale. Any other values are treated as 0.

\[
\text{ustrcompareex}( \text{"Café"}, \text{"café"}, \text{"fr"}, -1, 1, -1, -1, -1, -1, -1) = -1 \\
\text{ustrcompareex}( \text{"Café"}, \text{"café"}, \text{"fr"}, -1, 2, -1, -1, -1, -1, -1) = 1
\]

cslv controls whether an extra case level between the secondary level and the tertiary level is generated. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. Any other values are treated as 0. Combining this setting to be “on” and the strength setting to be primary can achieve the effect of ignoring the diacritical differences but preserving the case differences. If the setting is “on”, the result is also affected by the case setting.

\[
\text{ustrcompareex}( \text{"café"}, \text{"Cafe"}, \text{"fr"}, 1, -1, 1, -1, -1, -1, -1) = -1 \\
\text{ustrcompareex}( \text{"café"}, \text{"Cafe"}, \text{"fr"}, 1, 1, 1, -1, -1, -1, -1) = 1
\]

norm controls whether the normalization check and normalizations are performed. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. Any other values are treated as 0. Most languages do not require normalization for comparison. Normalization is needed in languages that use multiple combining characters such as Arabic, ancient Greek, or Hebrew.

num controls how contiguous digit substrings are sorted. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. Any other values are treated as 0. If the setting is “on”, substrings consisting of digits are sorted based on the numeric value. For example, “100” is after value “20” instead of before it. Note that the digit substring is limited to 254 digits, and plus/minus signs, decimals, or exponents are not supported.

\[
\text{ustrcompareex}( \text{"100"}, \text{"20"}, \text{"en"}, -1, -1, -1, -1, 0, -1, -1) = -1 \\
\text{ustrcompareex}( \text{"100"}, \text{"20"}, \text{"en"}, -1, -1, -1, 1, -1, -1, -1) = 1
\]

alt controls how spaces and punctuation characters are handled. Possible values are 0 (use primary strength) or 1 (alternative handling). Any other values are treated as 0. If the setting is 1 (alternative handling), “onsite”, “on-site”, and “on site” are considered equals.

\[
\text{ustrcompareex}( \text{"onsite"}, \text{"on-site"}, \text{"en"}, -1, -1, -1, -1, 1, -1, -1) = 0 \\
\text{ustrcompareex}( \text{"onsite"}, \text{"on site"}, \text{"en"}, -1, -1, -1, -1, 1, -1, -1) = 1
\]

fr controls the direction of the secondary strength. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. All other values are treated as “off”. If the setting is “on”, the diacritical letters are sorted backward. Note that the setting is “on” by default only for Canadian French (locale fr_CA).

\[
\text{ustrcompareex}( \text{"coté"}, \text{"côte"}, \text{"fr_CA"}, -1, -1, -1, -1, -1, 0) = -1 \\
\text{ustrcompareex}( \text{"coté"}, \text{"côte"}, \text{"fr_CA"}, -1, -1, -1, -1, -1, -1) = 1 \\
\text{ustrcompareex}( \text{"coté"}, \text{"côte"}, \text{"fr_CA"}, -1, -1, -1, -1, -1, -1) = 1 \\
\text{ustrcompareex}( \text{"coté"}, \text{"côte"}, \text{"fr"}, -1, -1, -1, -1, -1, -1) = 1
\]

`ustrfix(s[, rep])`

Description: replaces each invalid UTF-8 sequence with a Unicode character

In the one-argument case, the Unicode replacement character \ufffd is used. In the two-argument case, the first Unicode character of $rep$ is used. If $rep$ starts with an invalid UTF-8 sequence, then Unicode replacement character \ufffd is used. Note that an invalid UTF-8 sequence can contain one byte or multiple bytes.

```plaintext
ustrfix(char(200)) = ustrunescape("\ufffd")
ustrfix("ab"+char(200)+"cdé", ") = "abcdé"
ustrfix("ab"+char(229)+char(174)+"cdé", ") = "abécdé"
```

Domain $s$: Unicode strings  
Domain $rep$: Unicode character  
Range: Unicode strings

`ustrfrom(s, enc, mode)`

Description: converts the string $s$ in encoding $enc$ to a UTF-8 encoded Unicode string

$mode$ controls how invalid byte sequences in $s$ are handled. The possible values are 1, which substitutes an invalid byte sequence with a Unicode replacement character \ufffd; 2, which skips any invalid byte sequences; 3, which stops at the first invalid byte sequence and returns an empty string; or 4, which replaces any byte in an invalid sequence with an escaped hex digit sequence %Xhh. Any other values are treated as 1. A good use of value 4 is to check what invalid bytes a Unicode string $ust$ contains by examining the result of `ustrfrom(ust, "utf-8", 4)`.

Also see `ustrto()`.

```plaintext
ustrfrom("caf"+char(233), "latin1", 1) = "café"
ustrfrom("caf"+char(233), "utf-8", 1) = "caf"+ustrunescape("\ufffd")
ustrfrom("caf"+char(233), "utf-8", 2) = "caf"
ustrfrom("caf"+char(233), "utf-8", 3) = ""
ustrfrom("caf"+char(233), "utf-8", 4) = "caf%XE9"
```

Domain $s$: strings in encoding $enc$  
Domain $enc$: Unicode strings  
Domain $mode$: integers  
Range: Unicode strings
ustrinvalidcnt(\textit{s})
Description: the number of invalid UTF-8 sequences in \textit{s}

An invalid UTF-8 sequence may contain one byte or multiple bytes.

\begin{align*}
\text{ustrinvalidcnt(“médiann\text{"e}e“)} &= 0 \\
\text{ustrinvalidcnt(“médiann\text{"e}e“} + \text{\text{char}(229)}) &= 1 \\
\text{ustrinvalidcnt(“médiann\text{"e}e“} + \text{\text{char}(229)} + \text{\text{char}(174)}) &= 1 \\
\text{ustrinvalidcnt(“médiann\text{"e}e“} + \text{\text{char}(174)} + \text{\text{char}(158)}) &= 2 \\
\end{align*}

\textbf{Domain \textit{s}}: Unicode strings
\textbf{Range}: integers

ustrleft(\textit{s}, \textit{n})
Description: the first \textit{n} Unicode characters of the Unicode string \textit{s}

An invalid UTF-8 sequence is replaced with a Unicode replacement character \textbackslash ufffd.

\begin{align*}
\text{ustrleft(“Экспериментальные”,3)} &= “Экс” \\
\text{ustrleft(“Экспериментальные”,5)} &= “Экспе” \\
\end{align*}

\textbf{Domain \textit{s}}: Unicode strings
\textbf{Domain \textit{n}}: integers
\textbf{Range}: Unicode strings

ustrnormalize(\textit{s}, norm)
Description: normalizes Unicode string \textit{s} to one of the five normalization forms specified by \textit{norm}

The normalization forms are nfc, nfd, nfkc, nfkd, or nfkcc. The function returns an empty string for any other value of \textit{norm}. Unicode normalization removes the Unicode string differences caused by Unicode character equivalence. nfc specifies Normalization Form C, which normalizes decomposed Unicode code points to a composited form. nfd specifies Normalization Form D, which normalizes composited Unicode code points to a decomposed form. nfkc and nfkd produce canonical equivalent form. nfkc and nfkd are similar to nfc and nfd but produce compatibility equivalent forms. nfkcc specifies nfkc with casefolding. This normalization and casefolding implement the Unicode Character Database.

In the Unicode standard, both “i” (\textbackslash u0069 followed by a diaeresis \textbackslash u0308) and the composite character \textbackslash u00ef represent “i” with 2 dots as in “naïve”. Hence, the code-point sequence \textbackslash u0069\textbackslash u0308 and the code point \textbackslash u00ef are considered Unicode equivalent. According to the Unicode standard, they should be treated as the same single character in Unicode string operations, such as in display, comparison, and selection. However, Stata does not support multiple code-point characters; each code point is considered a separate Unicode character. Hence, \textbackslash u0069\textbackslash u0308 is displayed as two characters in the Results window. ustrnormalize() can be used with "nfc" to normalize \textbackslash u0069\textbackslash u0308 to the canonical equivalent composited code point \textbackslash u00ef.

\begin{align*}
\text{ustrnormalize(ustrunescape(“\textbackslash u0069\textbackslash u0308“), “nfc“)} &= “i” \\
\end{align*}
The decomposed form nfd can be used to removed diacritical marks from base letters. First, normalize the Unicode string to canonical decomposed form, and then call ustrto() with mode skip to skip all non-ASCII characters. Also see ustrfrom().

\[
\text{ustrto(ustrnormalize("café", "nfd"), "ascii", 2) = "cafe"}
\]

ustrright(s, n)
Description: the last \(n\) Unicode characters of the Unicode string \(s\)

An invalid UTF-8 sequence is replaced with a Unicode replacement character \ufffd.

ustrright("Экспериментальные", 3) = "ные"
ustrright("Экспериментальные", 5) = "льные"

ustrsortkey(s[, loc])
Description: generates a null-terminated byte array that can be used by the \texttt{sort} command to produce the same order as ustrcompare()

The function may return an empty array if an error occurs. The result is locale dependent. If \(loc\) is not specified, the default locale is used. The result is also diacritic and case sensitive. If you need different behavior, for example, case-insensitive results, you should use the extended function ustrsortkeyex(). See [U] 12.4.2.5 Sorting strings containing Unicode characters for details and examples.

</tbody>
</table>
ustrsortkeyex(s, loc, case, cslv, norm, num, alt, fr)

Description: generates a null-terminated byte array that can be used by the sort command to produce the same order as ustrcompare().

The function may return an empty array if an error occurs. The result is locale dependent. If loc is not specified, the default locale is used. See [U] 12.4.2.5 Sorting strings containing Unicode characters for details and examples.

st controls the strength of the comparison. Possible values are 1 (primary), 2 (secondary), 3 (tertiary), 4 (quaternary), or 5 (identical). -1 means to use the default value for the locale. Any other numbers are treated as tertiary. The primary difference represents base letter differences; for example, letter “a” and letter “b” have primary differences. The secondary difference represents diacritical differences on the same base letter; for example, letters “a” and “¨a” have secondary differences. The tertiary difference represents case differences of the same base letters; for example, letters “a” and “A” have tertiary differences. Quaternary strength is useful to distinguish between Katakana and Hiragana for the JIS 4061 collation standard. Identical strength is essentially the code-point order of the string and, hence, is rarely useful.

case controls the uppercase and lowercase letter order. Possible values are 0 (use order specified in tertiary strength), 1 (uppercase first), or 2 (lowercase first). -1 means to use the default value for the locale. Any other values are treated as 0.

cslv controls if an extra case level between the secondary level and the tertiary level is generated. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. Any other values are treated as 0. Combining this setting to be “on” and the strength setting to be primary can achieve the effect of ignoring the diacritical differences but preserving the case differences. If the setting is “on”, the result is also affected by the case setting.

norm controls whether the normalization check and normalizations are performed. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. Any other values are treated as 0. Most languages do not require normalization for comparison. Normalization is needed in languages that use multiple combining characters such as Arabic, ancient Greek, or Hebrew.

num controls how contiguous digit substrings are sorted. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. Any other values are treated as 0. If the setting is “on”, substrings consisting of digits are sorted based on the numeric value. For example, “100” is after “20” instead of before it. Note that the digit substring is limited to 254 digits, and plus/minus signs, decimals, or exponents are not supported.
String functions

alt controls how spaces and punctuation characters are handled. Possible values are 0 (use primary strength) or 1 (alternative handling). Any other values are treated as 0. If the setting is 1 (alternative handling), “onsite”, “on-site”, and “on site” are considered equals.

fr controls the direction of the secondary strength. Possible values are 0 (off) or 1 (on). -1 means to use the default value for the locale. All other values are treated as “off”. If the setting is “on”, the diacritical letters are sorted backward. Note that the setting is “on” by default only for Canadian French (locale fr_Ca).

ustrto(s, enc, mode)
Description: converts the Unicode string s in UTF-8 encoding to a string in encoding enc
See [D] unicode encoding for details on available encodings. Any invalid sequence in s is replaced with a Unicode replacement character \ufffd. mode controls how unsupported Unicode characters in the encoding enc are handled. The possible values are 1, which substitutes any unsupported characters with the enc’s substitution strings (the substitution character for both ascii and latin1 is char(26)); 2, which skips any unsupported characters; 3, which stops at the first unsupported character and returns an empty string; or 4, which replaces any unsupported character with an escaped hex digit sequence \uhhhh or \Uhhhhhhhh. The hex digit sequence contains either 4 or 8 hex digits, depending if the Unicode character’s code-point value is less than or greater than \uffff. Any other values are treated as 1.

ustrto("café", "ascii", 1) = "caf"+char(26)
ustrto("café", "ascii", 2) = "caf"
ustrto("café", "ascii", 3) = ""
ustrto("café", "ascii", 4) = "caf\u00E9"

ustrto() can be used to removed diacritical marks from base letters. First, normalize the Unicode string to NFD form using ustrnormalize(), and then call ustrto() with value 2 to skip all non-ASCII characters.

Also see ustrfrom().

ustrto(ustrnormalize("café", "nfd"), "ascii", 2) = "cafe"
ustrtohex(s[n])
Description: escaped hex digit string of \(s\) up to 200 Unicode characters

The escaped hex digit string is in the form of \(\uhhhh\) for code points less than \(\uffff\) or \(\uhhhhhhh\) for code points greater than \(\uffff\). The function starts at the \(n\)th Unicode character of \(s\) if \(n\) is specified and larger than 0. Any invalid UTF-8 sequence is replaced with a Unicode replacement character \(\ufffd\). Note that the null terminator \(\text{char}(0)\) is a valid Unicode character. Function \(\text{ustrunescape()}\) can be applied on the result to get back the original Unicode string \(s\) if \(s\) does not contain any invalid UTF-8 sequences.

Also see \(\text{ustrunescape()}\).

\[
\begin{align*}
\text{ustrtohex("н\u0443\u0443\u044e") } &= "\u0069\ufffd\u0000\u0073" \\
\text{ustrtohex("нұлю", 2) } &= "\u0443\u043b\u044e" \\
\text{ustrtohex("i"+char(200)+char(0)+"s") } &= "\u0069\ufffd\u0000\u0073"
\end{align*}
\]

\(\text{Domain } s:\) Unicode strings
\(\text{Domain } n:\) integers \(\geq 1\)
\(\text{Range: }\) strings

ustrunescape(s)
Description: the Unicode string corresponding to the escaped sequences of \(s\)

The following escape sequences are recognized: 4 hex digit form \(\uhhhh\); 8 hex digit form \(\uhhhhhhh\); 1–2 hex digit form \(\xhh\); and 1–3 octal digit form \(\ooo\), where \(h\) is \([0–9A–Fa–f]\) and \(o\) is \([0–7]\). The standard ANSI C escapes \(\a, \b, \t, \n, \v, \f, \r, \e, \", \', \?, \\) are recognized as well. The function returns an empty string if an escape sequence is badly formed. Note that the 8 hex digit form \(\uhhhhhhh\) begins with a capital letter “U”.

Also see \(\text{ustrtohex()}\).

\[
\begin{align*}
\text{ustrunescape("\u043d\u0443\u0443\u044e") } &= "нұлю"
\end{align*}
\]

\(\text{Domain } s:\) strings of escaped hex values
\(\text{Range: }\) Unicode strings

word(s,n)
Description: the \(n\)th word in \(s\); missing (""") if \(n\) is missing

Positive numbers count words from the beginning of \(s\), and negative numbers count words from the end of \(s\). (1 is the first word in \(s\), and -1 is the last word in \(s\).) A word is a set of characters that start and terminate with spaces. This is different from a Unicode word, which is a language unit based on either a set of word-boundary rules or dictionaries for several languages (Chinese, Japanese, and Thai).

\(\text{Domain } s:\) strings
\(\text{Domain } n:\) integers
\(\text{Range: }\) strings
ustrword(s, n[, loc])

Description: the \( n \)th Unicode word in the Unicode string \( s \)

Positive \( n \) counts Unicode words from the beginning of \( s \), and negative \( n \) counts Unicode words from the end of \( s \). For examples, \( n \) equal to 1 returns the first word in \( s \), and \( n \) equal to \(-1\) returns the last word in \( s \). If \( loc \) is not specified, the default locale is used. A Unicode word is different from a Stata word produced by the \texttt{word()} function. A Stata word is a space-separated token. A Unicode word is a language unit based on either a set of word-boundary rules or dictionaries for some languages (Chinese, Japanese, and Thai). The function returns \texttt{missing (""')} if \( n \) is greater than \( cnt \) or less than \(-cnt\), where \( cnt \) is the number of words \( s \) contains. \( cnt \) can be obtained from \texttt{ustrwordcount()} . The function also returns \texttt{missing (""')} if an error occurs.

\begin{verbatim}
ustrword("Parlez-vous français", 1, "fr") = "Parlez"
ustrword("Parlez-vous français", 2, "fr") = "-"
ustrword("Parlez-vous français",-1, "fr") = "français"
ustrword("Parlez-vous français",-2, "fr") = "vous"
\end{verbatim}

Domain \( s \): Unicode strings
Domain \( loc \): Unicode strings
Domain \( n \): integers
Range: Unicode strings

wordbreaklocale(loc, type)

Description: the most closely related locale supported by ICU from \( loc \) if \( type \) is 1, the actual locale where the word-boundary analysis data come from if \( type \) is 2; or an empty string is returned for any other \( type \)

\begin{verbatim}
wordbreaklocale("en_us_texas", 1) = en_US
wordbreaklocale("en_us_texas", 2) = root
\end{verbatim}

Domain \( loc \): strings of locale name
Domain \( type \): integers
Range: strings

wordcount(s)

Description: the number of words in \( s \)

A word is a set of characters that starts and terminates with spaces, starts with the beginning of the string, or terminates with the end of the string. This is different from a Unicode word, which is a language unit based on either a set of word-boundary rules or dictionaries for several languages (Chinese, Japanese, and Thai).

Domain \( s \): strings
Range: nonnegative integers 0, 1, 2, \ldots
ustrwordcount(s[,loc])

Description: the number of nonempty Unicode words in the Unicode string s

An empty Unicode word is a Unicode word consisting of only Unicode whitespace characters. If loc is not specified, the default locale is used. A Unicode word is different from a Stata word produced by the word() function. A Stata word is a space-separated token. A Unicode word is a language unit based on either a set of word-boundary rules or dictionaries for some languages (Chinese, Japanese, and Thai). The function may return a negative number if an error occurs.

ustrwordcount("Parlez-vous français", "fr") = 4

Domain s: Unicode strings
Domain loc: Unicode strings
Range: integers
