**Description**

`graph twoway lowess` plots a lowess smooth of `yvar` on `xvar` using `graph twoway line`; see `[G-2] graph twoway line`.

**Quick start**

Local linear smooth plot of `y` versus `x` using Cleveland’s tricube weighting function with a bandwidth of 0.8

```
twoway lowess y x
```

As above, overlaid on a scatterplot of `y` versus `x`

```
twoway scatter y x || lowess y x
```

As above, but draw points with less intense color to make the line more visible

```
twoway scatter y x, mcolor(*.6) || lowess y x
```

Use running-mean smoothing

```
twoway scatter y x || lowess y x, mean
```

Specify a bandwidth of 0.5

```
twoway scatter y x || lowess y x, bwidth(.5)
```

Suppress use of Cleveland’s tricube weighting function

```
twoway scatter y x || lowess y x, noweight
```

**Menu**

Graphics > Twoway graph (scatter, line, etc.)
**Syntax**

```
twoway lowess yvar xvar [if] [in] [ , options ]
```

**options**

**Options**

- `bwidth(#)`: specifies the bandwidth. `bwidth(.8)` is the default. Centered subsets of \( N \times bwidth() \) observations, \( N \) = number of observations, are used for calculating smoothed values for each point in the data except for endpoints, where smaller, uncentered subsets are used. The greater the `bwidth()`, the greater the smoothing.
- `mean`: specifies running-mean smoothing; the default is running-line least-squares smoothing.
- `noweight`: prevents the use of Cleveland’s (1979) tricube weighting function; the default is to use the weighting function.
- `logit`: transforms the smoothed `yvar` into logits.
- `adjust`: adjusts by multiplication the mean of the smoothed `yvar` to equal the mean of `yvar`. This is useful when smoothing binary (0/1) data.
- `cline_options`: specify how the lowess line is rendered and its appearance; see [G-3] `cline_options`.
- `axis_choice_options`: associate the plot with a particular `y` or `x` axis on the graph; see [G-3] `axis_choice_options`.
- `twoway_options`: are a set of common options supported by all `twoway` graphs. These options allow you to title graphs, name graphs, control axes and legends, add lines and text, set aspect ratios, create graphs over `by()` groups, and change some advanced settings. See [G-3] `twoway_options`.

**Remarks and examples**

```
graph twoway lowess yvar xvar uses the lowess command—see [R] lowess—to obtain a local linear smooth of `yvar` on `xvar` and uses `graph twoway line` to plot the result.
```

Remarks are presented under the following headings:

- **Typical use**
- **Use with by()**
Typical use

The local linear smooth is often graphed on top of the data, possibly with other regression lines:

```
. use https://www.stata-press.com/data/r16/auto
   (1978 Automobile Data)
   . twoway scatter mpg weight, mcolor(*.6) ||
      lfit mpg weight ||
      lowess mpg weight
```

Notice our use of `mcolor(*.6)` to dim the points and thus make the lines stand out; see [G-4] `colorstyle`.
Use with by()

`graph twoway lowess` may be used with `by()`

```stata
. use https://www.stata-press.com/data/r16/auto, clear
   (1978 Automobile Data)
. twoway scatter mpg weight, mcolor(*.6) ||
    lfit mpg weight ||
    lowess mpg weight ||, by(foreign)
```
