axis_scale_options — Options for specifying axis scale, range, and look

Description

The axis_scale_options determine how axes are scaled (arithmetic, log, reversed), the range of the axes, and the look of the lines that are the axes.

Quick start

Put the y axis on a log scale

```
graph_command ..., ... yscale(log)
```

Reverse the order of the ticks and labels on the x axis

```
graph_command ..., ... xscale(reverse)
```

Make the width of the line for the x axis thick

```
graph_command ..., ... xscale(lwidth(thick))
```

As above, but specify line width as 18 point

```
graph_command ..., ... xscale(lwidth(18pt))
```

Turn off the x axis

```
graph_command ..., ... xscale(off)
```
Syntax

`axis_scale_options` are a subset of `axis_options`; see [G-3] `axis_options`.

```
<table>
<thead>
<tr>
<th>axis_scale_options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>yscale(axis_suboptions)</code></td>
<td>how y axis looks</td>
</tr>
<tr>
<td><code>xscale(axis_suboptions)</code></td>
<td>how x axis looks</td>
</tr>
<tr>
<td><code>tscale(axis_suboptions)</code></td>
<td>how t (time) axis looks</td>
</tr>
<tr>
<td><code>zscale(axis_suboptions)</code></td>
<td>how contour legend axis looks</td>
</tr>
</tbody>
</table>
```

The above options are `merged-implicit`; see [G-4] `Concept: repeated options`.

```
<table>
<thead>
<tr>
<th>axis_suboptions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>axis(#)</code></td>
<td>which axis to modify; 1 ≤ # ≤ 9</td>
</tr>
<tr>
<td><code>[no] log</code></td>
<td>use logarithmic scale</td>
</tr>
<tr>
<td><code>[no] reverse</code></td>
<td>reverse scale to run from max to min</td>
</tr>
<tr>
<td><code>range(numlist)</code></td>
<td>expand range of axis</td>
</tr>
<tr>
<td><code>range(datelist)</code></td>
<td>expand range of t axis (tscale() only)</td>
</tr>
<tr>
<td><code>off</code> and <code>on</code></td>
<td>suppress/force display of axis</td>
</tr>
<tr>
<td><code>fill</code></td>
<td>allocate space for axis even if off</td>
</tr>
<tr>
<td><code>alt</code></td>
<td>move axis from left to right or from top to bottom</td>
</tr>
<tr>
<td><code>fextend</code></td>
<td>extend axis line through plot region and plot region’s margin</td>
</tr>
<tr>
<td><code>extend</code></td>
<td>extend axis line through plot region</td>
</tr>
<tr>
<td><code>noextend</code></td>
<td>do not extend axis line at all</td>
</tr>
<tr>
<td><code>noline</code></td>
<td>do not draw axis line</td>
</tr>
<tr>
<td><code>line</code></td>
<td>force drawing of axis line</td>
</tr>
<tr>
<td><code>titlegapsize</code></td>
<td>margin between axis title and tick labels</td>
</tr>
<tr>
<td><code>outergapsize</code></td>
<td>margin outside axis title</td>
</tr>
<tr>
<td><code>lstyle(linestyle)</code></td>
<td>overall style of axis line</td>
</tr>
<tr>
<td><code>lcolor(colorstyle)</code></td>
<td>color and opacity of axis line</td>
</tr>
<tr>
<td><code>lwidth(linewidthstyle)</code></td>
<td>thickness of axis line</td>
</tr>
<tr>
<td><code>lpattern(linepatternstyle)</code></td>
<td>axis pattern (solid, dashed, etc.)</td>
</tr>
</tbody>
</table>
```

Options

`yscale(axis_suboptions)`, `xscale(axis_suboptions)`, and `tscale(axis_suboptions)` specify the look of the y, x, and t axes. The t axis is an extension of the x axis. Inside the parentheses, you specify `axis_suboptions`.

`zscale(axis_suboptions)`; see `Contour axes—zscale()` below.
Suboptions

axis(#) specifies to which scale this axis belongs and is specified when dealing with multiple y or x axes; see [G-3] \texttt{axis_choice_options}.

\texttt{log} and \texttt{nolog} specify whether the scale should be logarithmic or arithmetic. \texttt{nolog} is the usual default, so \texttt{log} is the option. See \textit{Obtaining log scales} under Remarks and examples below.

\texttt{reverse} and \texttt{noreverse} specify whether the scale should run from the maximum to the minimum or from the minimum to the maximum. \texttt{noreverse} is the usual default, so \texttt{reverse} is the option. See \textit{Obtaining reversed scales} under Remarks and examples below.

\texttt{range(numlist)} specifies that the axis be expanded to include the numbers specified. Missing values, if specified, are ignored. See \textit{Specifying the range of a scale} under Remarks and examples below.

\texttt{range(datelist) (tscale() only)} specifies that the axis be expanded to include the specified dates; see [U] 11.1.9 \texttt{datelist}. Missing values, if specified, are ignored. See [TS] \texttt{tsline} for examples.

\texttt{off} and \texttt{on} suppress or force the display of the axis. \texttt{on} is the default and \texttt{off} the option. See \textit{Suppressing the axes} under Remarks and examples below.

\texttt{fill} goes with \texttt{off} and is seldom specified. If you turned an axis off but still wanted the space to be allocated for the axis, you could specify \texttt{fill}.

\texttt{alt} specifies that, if the axis is by default on the left, it be on the right; if it is by default on the bottom, it is to be on the top. The following would draw a scatterplot with the y axis on the right:

\begin{verbatim}
    . scatter yvar xvar, yscale(alt)
\end{verbatim}

\texttt{fextend, extend, noextend, line, and noline} determine how much of the line representing the axis is to be drawn. They are alternatives.

\texttt{noline} specifies that the line not be drawn at all. The axis is there, ticks and labels will appear, but the line that is the axis itself will not be drawn.

\texttt{line} is the opposite of \texttt{noline}, for use if the axis line somehow got turned off.

\texttt{noextend} specifies that the axis line not extend beyond the range of the axis. Say that the axis extends from $-1$ to $+20$. With \texttt{noextend}, the axis line begins at $-1$ and ends at $+20$.

\texttt{extend} specifies that the line be longer than that and extend all the way across the plot region. For instance, $-1$ and $+20$ might be the extent of the axis, but the scale might extend from $-5$ to $+25$, with the range $[-5, -1)$ and $(20, 25]$ being unlabeled on the axis. With \texttt{extend}, the axis line begins at $-5$ and ends at 25.

\texttt{fextend} specifies that the line be longer than that and extend across the plot region and across the plot region’s margins. For a definition of the plot region’s margins, see [G-3] \textit{region_options}. If the plot region has no margins (which would be rare), \texttt{fextend} means the same as \texttt{extend}. If the plot region does have margins, \texttt{extend} would result in the y and x axes not meeting. With \texttt{fextend}, they touch.

\texttt{fextend} is the default with most schemes.

\texttt{titlegap(size)} specifies the margin to be inserted between the axis title and the axis tick labels; see [G-4] \textit{size}.

\texttt{outergap(size)} specifies the margin to be inserted outside the axis title; see [G-4] \textit{size}.

\texttt{lstyle(linestyle), lcolor(colorstyle), lwidth(linewidthstyle), and lpattern(linepatternstyle)} determine the overall look of the line that is the axis; see [G-4] \textit{Concept: lines}. 

Remarks and examples

*axis_scale_options* are a subset of *axis_options*; see [G-3] *axis_options* for an overview. The other appearance options are

*axis_label_options*  
(see [G-3] *axis_label_options*)

*axis_title_options*  
(see [G-3] *axis_title_options*)

Remarks are presented under the following headings:

- Use of the *yscale()* and *xscale()*
- Specifying the range of a scale
- Obtaining log scales
- Obtaining reversed scales
- Suppressing the axes
- Contour axes—*zscale()*

Use of the *yscale()* and *xscale()*

*yscale()* and *xscale()* specify the look of the *y* and *x* axes. Inside the parentheses, you specify *axis_suboptions*, for example:

```
.twoway (scatter ...) ..., yscale(range(0 10) titlegap(1))
```

*yscale()* and *xscale()* may be abbreviated *ysc()* and *xsc()*, suboption *range()* may be abbreviated *r()*, and *titlegap()* may be abbreviated *titleg()*:

```
.twoway (scatter ...) ..., ysc(r(0 10) titleg(1))
```

Multiple *yscale()* and *xscale()* options may be specified on the same command, and their results will be combined. Thus the above command could also be specified

```
.twoway (scatter ...) ..., ysc(r(0 10)) ysc(titleg(1))
```

Suboptions may also be specified more than once, either within one *yscale()* or *xscale()* option, or across multiple options, and the rightmost suboption will take effect. In the following command, *titlegap()* will be 2, and *range()* 0 and 10:

```
.twoway (scatter ...) ..., ysc(r(0 10)) ysc(titleg(1)) ysc(titleg(2))
```

Specifying the range of a scale

To specify the range of a scale, specify the `{y|x}*scale(range(numlist))* option. This option specifies that the axis be expanded to include the numbers specified.

Consider the graph

```
.scatter yvar xvar
```

Assume that it resulted in a graph where the *y* axis varied over 1–100 and assume that, given the nature of the *y* variable, it would be more natural if the range of the axis were expanded to go from 0 to 100. You could type

```
.scatter yvar xvar, ysc(r(0))
```

Similarly, if the range without the *yscale(range())* option went from 1 to 99 and you wanted it to go from 0 to 100, you could type

```
.scatter yvar xvar, ysc(r(0 100))
```
If the range without `yscale(range())` went from 0 to 99 and you wanted it to go from 0 to 100, you could type

```
.scatter yvar xvar, ysc(r(100))
```

Specifying missing for a value leaves the current minimum or maximum unchanged; specifying a nonmissing value changes the range, but only if the specified value is outside the value that would otherwise have been chosen. `range()` never narrows the scale of an axis or causes data to be omitted from the plot. If you wanted to graph `yvar` versus `xvar` for the subset of `xvar` values between 10 and 50, typing

```
.scatter yvar xvar, xsc(r(10 50))
```

would not suffice. You need to type

```
.scatter yvar xvar if xvar >=10 & xvar <=50
```

### Obtaining log scales

To obtain log scales specify the `{ y | x }scale(log)` option. Ordinarily when you draw a graph, you obtain arithmetic scales:

```
.use https://www.stata-press.com/data/r16/lifeexp, clear
(Life expectancy, 1998)
.scatter lexp gnppc
```

![Graph showing life expectancy vs. GNP per capita with log scales]
To obtain the same graph with a log $x$ scale, we type

```
.scatter lexp gnppc, xscale(log)
```

We obtain the same graph as if we typed

```
.generate log_gnppc = log(gnppc)
.scatter lexp log_gnppc
```

The difference concerns the labeling of the axis. When we specify `{y|x}scale(log)`, the axis is labeled in natural units. Here the overprinting of the 30,000 and 40,000 is unfortunate, but we could fix that by dividing `gnppc` by 1,000.

**Obtaining reversed scales**

To obtain reversed scales—scales that run from high to low—specify the `{y|x}scale(reverse)` option:

```
.use https://www.stata-press.com/data/r16/auto, clear
.use https://www.stata-press.com/data/r16/auto, clear
(1978 Automobile Data)
.scatter mpg weight, yscale(reverse)
```

```
Suppressing the axes

There are two ways to suppress the axes. The first is to turn them off completely, which means that the axis line is suppressed, along with all of its ticking, labeling, and titling. The second is to simply suppress the axis line while leaving the ticking, labeling, and titling in place.

The first is done by \{ y | x \} \texttt{scale(off)} and the second by \{ y | x \} \texttt{scale(noline)}. Also, you will probably need to specify the \texttt{plotregion(style(none))} option; see [G-3] \texttt{region_options}.

The axes and the border around the plot region are right on top of each other. Specifying \texttt{plotregion(style(none))} will do away with the border and reveal the axes to us:

```
. use https://www.stata-press.com/data/r16/auto, clear
   (1978 Automobile Data)
. scatter mpg weight, plotregion(style(none))
```

![Scatter plot with axes suppressed](image1)

To eliminate the axes, type

```
. scatter mpg weight, plotregion(style(none))
       yscale(off) xscale(off)
```

![Scatter plot with axes and border suppressed](image2)
To eliminate the lines that are the axes while leaving in place the labeling, ticking, and titling, type

```
.scatter mpg weight, plotregion(style(none))
    yscale(noline) xscale(noline)
```

Rather than using `{y|x}scale(noline)`, you may specify `{y|x}scale(lstyle(noline))` or `{y|x}scale(lstyle(none))`. They all mean the same thing.

**Contour axes—zscale()**

The `zscale()` option is unusual in that it applies not to axes on the plot region, but to the axis that shows the scale of a contour legend. It has effect only when the graph includes a `twoway contour` plot; see [G-2] `graph twoway contour`. In all other respects, it acts like `xscale()`, `yscale()`, and `tscale()`.
