

**goto** — goto label

[Description](#)[Syntax](#)[Remarks and examples](#)[Reference](#)[Also see](#)

## Description

`goto label` causes control to pass to the statement following `label:`. `label` may be any name up to eight characters long.

## Syntax

```
label: ...
      ...
      goto label
```

where `label:` may occur before or after the `goto`.

## Remarks and examples

stata.com

These days, good style is to avoid using `goto`.

`goto` is useful when translating a FORTRAN program, such as

```
A = 4.0e0/3.0e0
10 B = A - 1.0e0
   C = B + B + B
   EPS = DABS(C - 1.0e0)
   if (EPS.EQ.0.0e0) GOTO 10
```

The Mata translation is

```
          a = 4/3
s10:      b = a - 1
          c = b + b + b
          eps = abs(c-1)
          if (eps==0) goto s10
```

although

```
a = 4/3
do {
    b = a - 1
    c = b + b + b
    eps = abs(c - 1)
} while (eps==0)
```

is more readable.
