

## Description

`diag()` creates diagonal matrices.

`diag(Z)`,  $Z$  a matrix, extracts the principal diagonal of  $Z$  to create a new matrix.  $Z$  must be square.

`diag(z)`,  $z$  a vector, creates a new matrix with the elements of  $z$  on its diagonal.

## Syntax

*numeric matrix* `diag(numeric matrix Z)`

*numeric matrix* `diag(numeric vector z)`

## Remarks and examples

Do not confuse `diag()` with its functional inverse, `diagonal()`; see [M-5] **diagonal()**. `diag()` creates a matrix from a vector (or matrix); `diagonal()` extracts the diagonal of a matrix into a vector.

Use of `diag()` should be avoided because it wastes memory. The [colon operators](#) will allow you to use vectors directly:

Desired calculation	Equivalent
<code>diag(v)*X</code> ,	
$v$ is a column	$v:*X$
$v$ is a row	$v':*X$
$v$ is a matrix	<code>diagonal(v):*X</code>
<code>X*diag(v)</code>	
$v$ is a column	$X:*v'$
$v$ is a row	$X:*v$
$v$ is a matrix	$X:*diagonal(v)'$

In the above table, it is assumed that  $v$  is real. If  $v$  might be complex, the transpose operators that appear must be changed to `transposeonly()` calls, because we do not want the conjugate. For instance,  $v':*X$  would become `transposeonly(v):*X`.

## Conformability

diag( $Z$ ):

$Z$ :  $m \times n$   
 result:  $\min(m, n) \times \min(m, n)$

diag( $z$ ):

$z$ :  $1 \times n$  or  $n \times 1$   
 result:  $n \times n$

## Diagnostics

None.
