

Description

`editvalue(A, from, to)` returns *A* with all elements equal to *from* changed to *to*.

`_editvalue(A, from, to)` does the same thing but modifies *A* itself.

Syntax

```
matrix    editvalue(matrix A, scalar from, scalar to)
```

```
void      _editvalue(matrix A, scalar from, scalar to)
```

where *A*, *from*, and *to* may be real, complex, or string.

Remarks and examples

`editvalue()` and `_editvalue()` are fast.

If you wish to change missing values to nonmissing values, it is better to use [M-5] `editmissing()`.

`editvalue(A, ., 1)` would change all . missing values to 1 but leave .a, .b, ..., .z unchanged.

`editmissing(A, 1)` would change all missing values to 1.

Conformability

`editvalue(A, from, to):`

<i>A</i> :	$r \times c$
<i>from</i> :	1×1
<i>to</i> :	1×1
<i>result</i> :	$r \times c$

`_editvalue(A, from, to):`

input:

<i>A</i> :	$r \times c$
<i>from</i> :	1×1
<i>to</i> :	1×1

output:

<i>A</i> :	$r \times c$
------------	--------------

Diagnostics

`editvalue(A, from, to)` returns a matrix of the same type as *A*.

`editvalue(A, from, to)` and `_editvalue(A, from, to)` abort with error if *from* and *to* are incompatible with *A*. That is, if *A* is real, *to* and *from* must be real. If *A* is complex, *to* and *from* must each be either real or complex. If *A* is string, *to* and *from* must be string.

`_editvalue(A, from, to)` aborts with error if *A* is a view.
