```
exit() — Terminate execution
```

```
Description Syntax Remarks and examples Conformability
Diagnostics Also see
```

#### **Description**

```
\operatorname{exit}(rc) terminates execution and sets the overall return code to rc. \operatorname{exit}() with no argument specified is equivalent to \operatorname{exit}(0).
```

## **Syntax**

```
exit(real scalar rc)
exit()
```

#### Remarks and examples

stata.com

Do not confuse exit() and return. return stops execution of the current function and returns to the caller, whereupon execution continues. exit() terminates execution. For instance, consider

```
function first()
{
         "begin execution"
         second()
         "this message will never be seen"
}
function second()
{
         "hello from second()"
         exit(0)
}
```

The result of running this would be

```
: first()
 begin execution
 hello from second()
```

If we changed the exit(0) to be exit(198) in second(), the result would be

```
: first()
  begin execution
  hello from second()
r(198);
```

2

No error message is presented. If you want to present an error message and exit, you should code exit(error(198)); see [M-5] error().

# Conformability

```
exit(rc):

rc: 1 × 1 (optional)
```

# **Diagnostics**

exit(rc) and exit() do not return.
