

urlencode() — Convert URL into percent-encoded ASCII format

[Description](#)[Syntax](#)[Conformability](#)[Diagnostics](#)[Also see](#)

Description

`urlencode(s [, useplus])` converts a string into percent-encoded ASCII format for web transmission. It replaces reserved ASCII characters with a % followed by two hexadecimal digits. The function replaces a space with %20 if *useplus* is not specified or is 0; it replaces a space with a + if *useplus* is 1.

`urldecode(s)` decodes the string obtained from `urlencode()` and returns the original string.

Syntax

string scalar `urlencode(string scalar s [, real scalar useplus])`

string scalar `urldecode(string scalar s)`

Conformability

`urlencode(s [, useplus])`, `urldecode(s)`:

<i>s</i> :	1 × 1
<i>useplus</i> :	1 × 1
<i>result</i> :	1 × 1

Diagnostics

None.
