

**ustrreverse()** — Reverse Unicode string

[Description](#)  
[Diagnostics](#)

[Syntax](#)  
[Also see](#)

[Remarks and examples](#)

[Conformability](#)

## Description

`ustrreverse(string matrix s)` reverses the Unicode string *s*.

When arguments are not scalar, this function returns element-by-element results.

## Syntax

*string matrix* `ustrreverse(string matrix s)`

## Remarks and examples

[stata.com](#)

The function does not take [Unicode character equivalence](#) into consideration. Hence, a Unicode character in a decomposed form will not be reversed as one unit. An invalid UTF-8 sequence is replaced with a Unicode replacement character `\ufffd`.

Use `strreverse()` to return a string with its bytes in reverse order.

## Conformability

`ustrreverse(s)`:

*s*:  $r \times c$   
*result*:  $r \times c$

## Diagnostics

`ustrreverse(s)` returns an empty string if an error occurs.
