**estat sd — Display variance components as standard deviations and correlations**

**Description**

_estat sd_ displays the random-effects and within-group error parameter estimates as standard deviations and correlations.

**Menu for estat**

Statistics > Postestimation

**Syntax**

```
estat sd [, variance verbose post coeflegend]
```

**Options**

*variance* specifies that _estat sd_ display the random-effects and within-group error parameter estimates as variances and covariances. If the _post_ option is specified, the estimated variances and covariances and their respective standard errors are posted to _e()_. _variance_ is allowed only after _menl_.

*verbose* specifies that the full estimation table be displayed. By default, only the random-effects and within-group error parameters are displayed. This option is implied when _post_ is specified.

*post* causes _estat sd_ to behave like a Stata estimation (e-class) command. _estat sd_ posts the vector of calculated standard deviation and correlation parameters along with the corresponding variance–covariance matrix to _e()_, so that you can treat the estimated parameters just as you would results from any other estimation command. For example, you could use _test_ to perform simultaneous tests of hypotheses on the parameters, or you could use _lincom_ to create linear combinations.

The following option is not shown in the dialog box:

*coeflegend* specifies that the legend of the coefficients and how to specify them in an expression be displayed rather than displaying the statistics for the coefficients. This option is allowed only if one of _verbose_ or _post_ is also specified.

**Remarks and examples**

See example 1 in [ME] _mixed postestimation_ and example 16 in [ME] _menl_.

1
Stored results

estat sd stores the following in r():

Scalars
r(level) confidence level

Matrices
r(b) coefficient vector
r(V) variance–covariance matrix of the estimators
r(table) table of results

If post is specified, estat sd stores the following in e():

Macros
e(cmd) estat sd
e(properties) b V

Matrices
e(b) coefficient vector
e(V) variance–covariance matrix of the estimators
