mi import wide — Import wide-like data into mi

Description

mi import wide imports wide-like data, that is, data in which \( m = 0, m = 1, \ldots, m = M \) values of imputed and passive variables are recorded in separate variables.

mi import wide converts the data to \texttt{mi wide} style and \texttt{mi set} sets the data.

Menu

Statistics > Multiple imputation

Syntax

\begin{verbatim}
mi import wide [, options]
\end{verbatim}

<table>
<thead>
<tr>
<th>options</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{imputed} \texttt{(mvlist)}</td>
<td>imputed variables</td>
</tr>
<tr>
<td>\texttt{passive} \texttt{(mvlist)}</td>
<td>passive variables</td>
</tr>
<tr>
<td>\texttt{dupsok}</td>
<td>allow variable to be posted repeatedly</td>
</tr>
<tr>
<td>\texttt{drop}</td>
<td>drop imputed and passive after posting</td>
</tr>
<tr>
<td>\texttt{clear}</td>
<td>okay to replace unsaved data in memory</td>
</tr>
</tbody>
</table>

See description of options below for definition of \texttt{mvlist}.

Options

\texttt{imputed(mvlist)} and \texttt{passive(mvlist)} specify the imputed and passive variables.

For instance, if the data had two imputed variables, \( x \) and \( y \); \( x \) and \( y \) contained the \( m = 0 \) values; the corresponding \( m = 1 \), \( m = 2 \), and \( m = 3 \) values of \( x \) were in \( x1 \), \( x2 \), and \( x3 \); and the corresponding values of \( y \) were in \( y1 \), \( y2 \), and \( y3 \), then the \texttt{imputed()} option would be specified as

\begin{verbatim}
imputed(x=x1 x2 x3  y=y1 y2 y3)
\end{verbatim}

If variable \( y2 \) were missing from the data, you would specify

\begin{verbatim}
imputed(x=x1 x2 x3  y=y1 . y3)
\end{verbatim}

The same number of imputations must be specified for each variable.

\texttt{dupsok} specifies that it is okay if you specify the same variable name for two different imputations. This would be an odd thing to do, but if you specify \texttt{dupsok}, then you can specify

\begin{verbatim}
imputed(x=x1 x1 x3  y=y1 y2 y3)
\end{verbatim}

Without the \texttt{dupsok} option, the above would be treated as an error.
drop specifies that the original variables containing values for \(m = 1, m = 2, \ldots, m = M\) are to be dropped from the data once \texttt{mi import wide} has recorded the values. This option is recommended.

clear specifies that it is okay to replace the data in memory even if they have changed since they were last saved to disk.

### Remarks and examples

The procedure to convert wide-like data to \texttt{mi} wide style is this:

1. use the unset data; see \texttt{[D] use}.

2. Issue the \texttt{mi import wide} command.

3. Use \texttt{mi describe} (see \texttt{[MI] mi describe}) and \texttt{mi varying} (see \texttt{[MI] mi varying}) to verify that the result is as you anticipated.

4. Optionally, use \texttt{mi convert} (see \texttt{[MI] mi convert}) to convert the data to what you consider a more convenient style.

For instance, you have been given unset dataset \texttt{wi.dta} and have been told that it contains variables \texttt{a}, \texttt{b}, and \texttt{c}; that variable \texttt{b} is imputed and contains \(m = 0\) values; that variables \texttt{b1} and \texttt{b2} contain the \(m = 1\) and \(m = 2\) values; that variable \texttt{c} is passive (equal to \texttt{a} + \texttt{b}) and contains \(m = 0\) values; and that variables \texttt{c1} and \texttt{c2} contain the corresponding \(m = 1\) and \(m = 2\) values. Here are the data:

```
 . use https://www.stata-press.com/data/r16/wi
 (mi prototype)
 . list

    a  b  c  b1  b2  c1  c2
 1. 1   2  3   2   2   3   3
 2. 4 . .   4.5 5.5  8.5  9.5
```

These are the same data discussed in \texttt{[MI] Styles}. To import these data, type

```
 . mi import wide, imputed(b=b1 b2  c=c1 c2) drop
```

These data are short enough that we can list the result:

```
 . list

 a  b  c  _mi_miss  _1_b  _2_b  _1_c  _2_c
 1. 1  2  3   0  2  2  3  3
 2. 4 . .   1  4.5 5.5  8.5  9.5
```
Returning to the procedure, we run `mi describe` and `mi varying` on the result:

```plaintext
. mi describe
Style: wide
    last mi update 10may2019 16:34:48, 0 seconds ago
Obs.: complete 1
      incomplete 1 (M = 2 imputations)
      total 2
Vars.: imputed: 2; b(1) c(1)
      passive: 0
      regular: 0
      system: 1; _mi_miss
      (there is one unregistered variable; a)
. mi varying
     Possible problem variable names

     imputed nonvarying: (none)
     passive nonvarying: (none)
```

Perhaps you would prefer seeing these data in flong style:

```plaintext
. mi convert flong, clear
. list, separator(2)

<table>
<thead>
<tr>
<th></th>
<th>a</th>
<th>b</th>
<th>c</th>
<th>_mi_miss</th>
<th>_mi_m</th>
<th>_mi_id</th>
</tr>
</thead>
<tbody>
<tr>
<td>1.</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
<tr>
<td>2.</td>
<td>4</td>
<td>.</td>
<td>.</td>
<td>1</td>
<td>0</td>
<td>2</td>
</tr>
<tr>
<td>3.</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>.</td>
<td>1</td>
<td>1</td>
</tr>
<tr>
<td>4.</td>
<td>4</td>
<td>4.5</td>
<td>8.5</td>
<td>.</td>
<td>1</td>
<td>2</td>
</tr>
<tr>
<td>5.</td>
<td>1</td>
<td>2</td>
<td>3</td>
<td>.</td>
<td>2</td>
<td>1</td>
</tr>
<tr>
<td>6.</td>
<td>4</td>
<td>5.5</td>
<td>9.5</td>
<td>.</td>
<td>2</td>
<td>2</td>
</tr>
</tbody>
</table>
```
