Description

`fvexpand` expands a factor varlist to the corresponding expanded, specific varlist. `varlist` may be general or specific and even may already be expanded.

Syntax

```
fvexpand [varlist] [if] [in]
```

`varlist` may contain factor variables and time-series operators; see [U] 11.4.3 Factor variables and [U] 11.4.4 Time-series varlists.

Remarks and examples

An example of a general factor varlist is `mpg i.foreign`. The corresponding specific factor varlist would be `mpg i(0 1)b0.foreign` if `foreign` took on the values 0 and 1 in the data.

A specific factor varlist is specific with respect to a given problem, which is to say, a given dataset and subsample. The specific varlist identifies the values taken on by factor variables and the base.

Factor varlist `mpg i(0 1)b0.foreign` is specific. The same varlist could be written as `mpg i0b.foreign i1.foreign`, so that is specific, too. The first is unexpanded and specific. The second is expanded and specific.

`fvexpand` takes a general or specific (expanded or unexpanded) factor varlist, along with an optional if or in, and returns a fully expanded, specific varlist.

Stored results

`fvexpand` stores the following in `r()`:

- **r(varlist)**: the expanded, specific varlist
- **r(fvops)**: true if `varlist` contains factor variables
- **r(tsops)**: true if `varlist` contains time-series operators
