GUI (power) — Graphical user interface for power and sample-size analysis

Description

This entry describes the graphical user interface (GUI) for the `power` command. See [PSS-2] `power` for a general introduction to the `power` command.

Menu

Statistics > Power, precision, and sample size

Remarks and examples

Remarks are presented under the following headings:

PSS Control Panel

Example using PSS Control Panel

PSS Control Panel

You can perform PSS analysis interactively by typing the `power` command or by using a point-and-click GUI available via the PSS Control Panel.

The PSS Control Panel can be accessed by selecting Statistics > Power, precision, and sample size from the Stata menu. It includes a tree-view organization of the PSS and PrSS methods.
The left pane organizes the methods, and the right pane displays the methods corresponding to the selection in the left pane. On the left, the methods are organized by the type of population parameter, such as mean or proportion; the type of outcome, such as continuous or binary; the type of analysis, such as hypothesis test or confidence interval; and the type of sample, such as one sample or two samples. You click on one of the methods shown in the right pane to launch the dialog box for that method.

By default, methods are organized by **Population parameter**. We can find the method we want to use by looking for it in the right pane, or we can narrow down the type of method we are looking for by selecting one of the expanded categories in the left pane.
For example, if we are interested in means, we can click on Means within Population parameter to see all methods for means in the right pane.

We can expand Means to further narrow down the choices by clicking on the symbol to the left of Means.
Or we can choose a method by the type of analysis by expanding **Hypothesis test** and selecting, for example, **t tests**:
We can also locate methods by searching the titles of methods. You specify the search string of interest in the *Filter* box at the top right of the PSS Control Panel. For example, if we type “mean” in the *Filter* box while keeping the focus on **Hypothesis test**, only test methods with a title containing “mean” will be listed in the right pane.
We can specify multiple words in the Filter box, and only methods with all the specified words in their titles will appear. For example, if we type “two means”, only methods with the words “two” and “means” in their titles will be shown:

The search is performed within the group of methods selected by the choice in the left pane. In the above example, the search was done within Hypothesis test. When you search all methods, whether you select Population parameter, Outcome, or Sample in the left pane, the same set of methods appears in the right pane but in the order determined by the selected category.

Example using PSS Control Panel

In An example of PSS analysis in Stata in [PSS-2] Intro (power), we performed PSS analysis interactively by typing commands. We replicate the analysis by using the PSS Control Panel and dialog boxes.

We first launch the PSS Control Panel from the Statistics > Power, precision, and sample size menu. We then narrow down to the desired dialog box by first choosing Sample in the left pane, then choosing One sample within that, and then choosing Mean. In the right pane, we see methods for testing the one-sample mean. We are interested in the Test comparing one mean to a reference value.
We invoke the dialog box by clicking on the corresponding method title in the right pane. The following appears:
Following the example from An example of PSS analysis in Stata in [PSS-2] Intro (power), we now compute sample size. The first step is to choose which parameter to compute. The Compute drop-down box specifies Sample size, so we leave it unchanged. The next step is to specify error probabilities. The default significance level is already set to our desired value of 0.05, so we leave it unchanged. We change power from the default value of 0.8 to 0.9. We then specify a null mean of 514, an alternative mean of 534, and a standard deviation of 117 in the Effect size group of options. We leave everything else unchanged and click on the Submit button to obtain results.

The following command is displayed in the Results window and executed:

```
.powers onemean 514 534, power(0.9) sd(117)
Performing iteration ...
Estimated sample size for a one-sample mean test
t test
Ho: m = m0 versus Ha: m != m0
Study parameters:
    alpha = 0.0500
    power = 0.9000
    delta = 0.1709
    m0 = 514.0000
    ma = 534.0000
    sd = 117.0000
Estimated sample size:
    N = 362
```

We can verify that the command and results are exactly the same as what we specified in An example of PSS analysis in Stata of [PSS-2] Intro (power).
Continuing our PSS analysis, we now want to compute power for a sample of 300 subjects. We return to the dialog box and select Power under Compute. The only thing we need to specify is the sample size of 300:

![Image of the dialog box with selected options]

The following command is issued after we click on the Submit button:

```
. power onemean 514 534, n(300) sd(117)
```

Estimated power for a one-sample mean test

Ho: m = m0 versus Ha: m != m0

Study parameters:

- \( \alpha = 0.0500 \)
- \( N = 300 \)
- \( \delta = 0.1709 \)
- \( m_0 = 514.0000 \)
- \( m_a = 534.0000 \)
- \( sd = 117.0000 \)

Estimated power:

- \( \text{power} = 0.8392 \)

To compute effect size, we select Effect size and target mean under Compute. All the previously used values for power and sample size are preserved, so we do not need to specify anything additional.
We click on the **Submit** button and get the following:

```
. power onemean 514, power(0.9) n(300) sd(117)
Performing iteration ... 
Estimated target mean for a one-sample mean test
Ho: m = m0 versus Ha: m ! = m0; ma > m0
Study parameters:
    alpha =  0.0500
    power =  0.9000
    N = 300
    m0 = 514.0000
    sd = 117.0000
Estimated effect size and target mean:
    delta =  0.1878
    ma = 535.9671
```
To produce the graph from *An example of PSS analysis in Stata*, we first select *Power* under *Compute*. Then we specify the *numlists* for sample size and alternative mean in the respective edit boxes:
We also check the *Graph the results* box on the *Graph* tab:

We click on the **Submit** button and obtain the following command and graph:

```
. power onemean 514 (535(5)550), n(200(10)300) sd(117) graph
```
