

Postestimation commands

The following postestimation commands are available after `areg`:

Command	Description
<code>contrast</code>	contrasts and ANOVA-style joint tests of parameters
<code>estat ic</code>	Akaike's, consistent Akaike's, corrected Akaike's, and Schwarz's Bayesian information criteria (AIC, CAIC, AICc, and BIC, respectively)
<code>estat summarize</code>	summary statistics for the estimation sample
<code>estat vce</code>	variance–covariance matrix of the estimators (VCE)
<code>estimates</code>	cataloging estimation results
<code>etable</code>	table of estimation results
* <code>forecast</code>	dynamic forecasts and simulations
<code>hausman</code>	Hausman's specification test
<code>lincom</code>	point estimates, standard errors, testing, and inference for linear combinations of parameters
<code>linktest</code>	link test for model specification
<code>lrtest</code>	likelihood-ratio test
<code>margins</code>	marginal means, predictive margins, marginal effects, and average marginal effects
<code>marginsplot</code>	graph the results from margins (profile plots, interaction plots, etc.)
<code>nlcom</code>	point estimates, standard errors, testing, and inference for nonlinear combinations of parameters
<code>predict</code>	predictions and their SEs, residuals, etc.
<code>predictnl</code>	point estimates, standard errors, testing, and inference for generalized predictions
<code>pwcompare</code>	pairwise comparisons of parameters
<code>test</code>	Wald tests of simple and composite linear hypotheses
<code>testnl</code>	Wald tests of nonlinear hypotheses

*`forecast` is not appropriate with `mi` estimation results.

predict

Description for predict

predict creates a new variable containing predictions such as fitted values, standard errors, residuals, and the equation-level score.

Menu for predict

Statistics > Postestimation

Syntax for predict

```
predict [type] newvar [if] [in] [ , statistic]
```

where $y_j = \mathbf{x}_j\mathbf{b} + d_{\text{absorbvars}} + e_j$ and *statistic* is

statistic	Description
Main	
xb	$\mathbf{x}_j\mathbf{b}$, fitted values; the default
stdp	standard error of the prediction
dresiduals	$d_{\text{absorbvars}} + e_j = y_j - \mathbf{x}_j\mathbf{b}$
* xbd	$\mathbf{x}_j\mathbf{b} + d_{\text{absorbvars}}$
* d	$d_{\text{absorbvars}}$
* residuals	residual
* score	score; equivalent to residuals

Unstarred statistics are available both in and out of sample; type predict ... if e(sample) ... if wanted only for the estimation sample. Starred statistics are calculated only for the estimation sample, even when if e(sample) is not specified.

Options for predict

Main

- xb, the default, calculates the prediction of $\mathbf{x}_j\mathbf{b}$, the fitted values, by using the average effect of the absorbed variables. Also see xbd below.
- stdp calculates the standard error of $\mathbf{x}_j\mathbf{b}$.
- dresiduals calculates $y_j - \mathbf{x}_j\mathbf{b}$, which are the residuals plus the effects of the absorbed variables.
- xbd calculates $\mathbf{x}_j\mathbf{b} + d_{\text{absorbvars}}$, which are the fitted values including the effects of the absorbed variables.
- d calculates $d_{\text{absorbvars}}$, the effects of the absorbed variables.
- residuals calculates the residuals, that is, $y_j - (\mathbf{x}_j\mathbf{b} + d_{\text{absorbvars}})$.
- score is a synonym for residuals.

margins

Description for margins

margins estimates margins of response for fitted values.

Menu for margins

Statistics > Postestimation

Syntax for margins

```
margins [marginlist] [ , options ]
margins [marginlist] , predict(statistic ...) [options]
```

<i>statistic</i>	Description
xb	$\mathbf{x}_j\mathbf{b}$, fitted values; the default
stdp	not allowed with margins
<u>d</u> residuals	not allowed with margins
xbd	not allowed with margins
d	not allowed with margins
<u>r</u> esiduals	not allowed with margins
<u>s</u> core	not allowed with margins

Statistics not allowed with margins are functions of stochastic quantities other than $e(b)$.

For the full syntax, see [R] [margins](#).

Remarks and examples

► Example 1

Continuing with [example 1](#) of [R] [areg](#), we refit the model with robust standard errors and then obtain linear predictions and standard errors for those linear predictions.

```
. use https://www.stata-press.com/data/r19/auto2
(1978 automobile data)
. areg mpg weight gear_ratio, absorb(rep78) vce(robust)
(output omitted)
. predict xb_ar
(option xb assumed; fitted values)
. predict stdp_ar, stdp
```

We can obtain the same linear predictions by fitting the model with `xtreg`, `fe`, but we would first need to specify the panel structure by using `xtset`.

```
. xtset rep78
Panel variable: rep78 (unbalanced)
. xtreg mpg weight gear_ratio, fe vce(robust)
(output omitted)
. predict xb_xt
(option xb assumed; fitted values)
. predict stdp_xt, stdp
. summarize xb_ar xb_xt stdp*
```

Variable	Obs	Mean	Std. dev.	Min	Max
xb_ar	74	21.36805	4.286788	11.58643	28.07367
xb_xt	74	21.36805	4.286788	11.58643	28.07367
stdp_ar	74	.7105649	.1933936	.4270821	1.245179
stdp_xt	74	.8155919	.4826332	.0826999	1.709786

The predicted `xb` values above are the same for `areg` and `xtreg`, `fe`, but the standard errors for those linear predictions are different. The assumptions for these two estimators lead to different formulations for their standard errors. The robust variance estimates with `areg` are equivalent to the robust variance estimates using `regress`, including the panel dummies. The consistent robust variance estimates with `xtreg` are equivalent to those obtained by specifying `vce(cluster panelvar)` with that estimation command. For a theoretical discussion, see [Wooldridge \(2020\)](#), [Stock and Watson \(2008\)](#), and [Arellano \(2003\)](#); also see the [technical note](#) after example 3 of [\[XT\] xtreg](#).

◀

► Example 2

We would like to use `linktest` to check whether the dependent variable for our model is correctly specified:

```
. use https://www.stata-press.com/data/r19/auto2, clear
(1978 automobile data)
. areg mpg weight gear_ratio, absorb(rep78)
(output omitted)
```

```
. linktest, absorb(rep78)
```

```
Linear regression, absorbing indicators      Number of obs      =      69
Absorbed variable: rep78                  No. of categories  =       5
                                           F(2, 62)           =    46.50
                                           Prob > F            =    0.0000
                                           R-squared           =    0.6939
                                           Adj R-squared       =    0.6643
                                           Root MSE            =    3.3990
```

mpg	Coefficient	Std. err.	t	P> t	[95% conf. interval]	
_hat	-.9305602	.9537856	-0.98	0.333	-2.83715	.9760302
_hatsq	.0462785	.0227219	2.04	0.046	.0008582	.0916989
_cons	19.24899	9.725618	1.98	0.052	-.1922457	38.69022

F test of absorbed indicators: $F(4, 62) = 1.278$

Prob > F = 0.288

The squared fitted values are significant in the regression for `mpg` on the linear and squared fitted values; therefore, the test indicates that our dependent variable does not seem to be well specified. Let's transform the dependent variable into energy consumption, gallons per mile, fit the alternative model, and check the link test again.

```
. generate gpm = 1/mpg
. areg gpm weight gear_ratio, absorb(rep78)
(output omitted)
. linktest, absorb(rep78)
```

Linear regression, absorbing indicators
Absorbed variable: rep78

```
Number of obs      =      69
No. of categories  =       5
F(2, 62)           =    72.60
Prob > F           =  0.0000
R-squared          =  0.7436
Adj R-squared      =  0.7187
Root MSE          =  0.0068
```

	gpm	Coefficient	Std. err.	t	P> t	[95% conf. interval]	
	_hat	.2842582	.7109124	0.40	0.691	-1.136835	1.705352
	_hatsq	6.956965	6.862439	1.01	0.315	-6.760855	20.67478
	_cons	.0175457	.0178251	0.98	0.329	-.0180862	.0531777

F test of absorbed indicators: F(4, 62) = 0.065

Prob > F = 0.992

The link test supports the use of the transformed dependent variable.
