Example 17 — Correlated uniqueness model

Description

To demonstrate a correlated uniqueness model, we use the following summary statistics data:

```
. use https://www.stata-press.com/data/r16/sem_cu1 (Correlated uniqueness)
. ssd describe
```

```
obs: 500 Correlated uniqueness
vars: 9 18 Jan 2019 09:34
(_dta has notes)
```

</table>

```
. notes
_dta:
2. Summary statistics represent a sample of 500 patients who were evaluated for three personality disorders using three different methods.
3. The personality disorders include paranoid, schizotypal, and schizoid.
4. The methods of evaluation include a self-report inventory, ratings from a clinical interview, and observational ratings.
```

See Correlated uniqueness model in [SEM] Intro 5 for background.
Remarks and examples

Remarks are presented under the following headings:

Fitting the model
Fitting the model with the Builder

Fitting the model

We fit the following model:

```stata
.semm (Par -> par_i par_c par_o)
> (Szt -> szt_i szt_c szt_o)
> (Szd -> szd_i szd_c szd_o),
> covstr(e.par_i e.szt_i e.szd_i, unstructured)
> covstr(e.par_c e.szt_c e.szd_c, unstructured)
> covstr(e.par_o e.szt_o e.szd_o, unstructured)
> standardized
Endogenous variables
Measurement: par_i par_c par_o szt_i szt_c szt_o szd_i szd_c szd_o
Exogenous variables
Latent: Par Szt Szd
Fitting target model:
Iteration 0: log likelihood = -10210.31 (not concave)
Iteration 1: log likelihood = -10040.188 (not concave)
Iteration 2: log likelihood = -9971.4015
Iteration 3: log likelihood = -9918.0037
Iteration 4: log likelihood = -9883.6368
Iteration 5: log likelihood = -9880.0242
Iteration 6: log likelihood = -9879.9961
Iteration 7: log likelihood = -9879.9961
```
### Example 17 — Correlated uniqueness model

**Structural equation model**

- **Estimation method**: ml
- **Log likelihood**: -9879.9961

Given:
1. $\text{par}_i \sim \text{Par}$
2. $\text{szt}_i \sim \text{Szt}$
3. $\text{szd}_i \sim \text{Szd}$

Variances:
- $\text{var(Par)} = 1$
- $\text{var(Szt)} = 1$
- $\text{var(Szd)} = 1$
Example 17 — Correlated uniqueness model

LR test of model vs. saturated: chi2(15) = 14.37, Prob > chi2 = 0.4976

Notes:
1. We use the correlated uniqueness model fit above to analyze a multitrait–multimethod (MTMM) matrix. The MTMM matrix was developed by Campbell and Fiske (1959) to evaluate construct validity of measures. Each trait is measured using different methods, and the correlation matrix produced is used to evaluate whether measures that are related in theory are related in fact (convergent validity) and whether measures that are not intended to be related are not related in fact (discriminant validity).

In this example, the traits are the latent variables Par, Szt, and Szd.

The observed variables are the method–trait combinations.

The observed traits are the personality disorders paranoid (par), schotypal (szt), and schizoid (szd). The methods used to measure them are self-report (_i), clinical interview (_c), and observer rating (_o). Thus variable par_i is paranoid (par) measured by self-report (_i).

2. Note our use of the covstructure() option, which we abbreviated to covstr(). We used this option instead of cov() to save typing; see Correlated uniqueness model in [SEM] Intro 5.

3. Large values of the factor loadings (path coefficients) indicate convergent validity.

4. Small correlations between latent variables indicate discriminant validity.

Fitting the model with the Builder

Use the diagram above for reference.

There are many ways to draw this diagram. This one produces the cleanest diagram most easily.

1. Open the dataset.

   In the Command window, type

   . use https://www.stata-press.com/data/r16/sem_cu1
2. Open a new Builder diagram.
   Select menu item Statistics > SEM (structural equation modeling) > Model building and estimation.

3. Change the size of the observed variables’ rectangles.
   a. In the SEM Builder menu, select Settings > Variables > All observed...
   b. In the resulting dialog box, change the first size to .44 and click on OK.

4. Create the nine measurement variables.
   Select the Add observed variables set tool, , and then click in the far left of the diagram, about one-third of the way up from the bottom.
   In the resulting dialog box,
   a. select the Select variables radio button (it may already be selected);
   b. use the Variables control to select the nine variables in this order: par_i, szt_i, szd_i, par_c, szt_c, szd_c, par_o, szt_o, and szd_o;
   c. select Horizontal in the Orientation control;
   d. click on OK.
   If you wish, move the set of variables by clicking on any variable and dragging it.
   Be sure you select the observed variables in the order indicated above; otherwise, the instructions below for creating covariances among the errors will not be correct.

5. Create the set of three latent variables.
   Select the Add latent variables set tool, , and then click above the szt_i rectangle, about one-third of the way down from the top of the diagram.
   In the resulting dialog box,
   a. select the Select variables radio button (it may already be selected);
   b. type the three latent variable names Par, Szt, and Szd into the Variables control;
   c. select Horizontal in the Orientation control;
   d. select the Distances tab;
   e. select 1 (inch) from the Distance between variables control;
   f. click on OK.
   If you wish, move the set of variables by clicking on any variable and dragging it.
   We could have forgone specifying the distances between variables and simply dragged each variable where we wished after it was created.

6. Create the factor-loading paths.
   a. Select the Add path tool, −.
   b. Click in the bottom of the Par oval (it will highlight when you hover over it), and drag a path to the top of the par_i rectangle (it will highlight when you can release to connect the path).
Continuing with the tool, create the following paths by clicking first in the bottom of the latent variable and dragging it to the top of the observed (measurement) variable:

- $S_{zt} \rightarrow s_{zt\_i}$
- $S_{zd} \rightarrow s_{zd\_i}$
- $P_{ar} \rightarrow p_{ar\_c}$
- $S_{zt} \rightarrow s_{zt\_c}$
- $S_{zd} \rightarrow s_{zd\_c}$
- $P_{ar} \rightarrow p_{ar\_o}$
- $S_{zt} \rightarrow s_{zt\_o}$
- $S_{zd} \rightarrow s_{zd\_o}$

7. Clean up the direction of the errors.
   - We want all the errors to be below the measurement variables.
     a. Choose the Select tool, $\text{Select tool}$.  
     b. Click on the rectangle of any measurement variable whose associated error is not below it.
     c. Click on one of the Error rotation buttons, $\text{Error rotation}$, in the Contextual Toolbar until the error is below the measurement variable.

   Repeat this for all errors that are not below the measurement variables.

8. Correlate the errors within the self-report, clinical interview, and observer rating groups.
   a. Select the Add covariance tool, $\text{Add covariance}$.  
   b. Click in the $\epsilon^2$ circle (it will highlight when you hover over it), and drag a covariance to the $\epsilon^1$ circle (it will highlight when you can release to connect the covariance).
   c. Continue with the Add covariance tool, $\text{Add covariance}$, to create eight more covariances by clicking the first-listed error and dragging it to the second-listed error.

   \[
   \begin{align*}
   \epsilon_3 & \rightarrow \epsilon_2 \\
   \epsilon_3 & \rightarrow \epsilon_1 \\
   \epsilon_5 & \rightarrow \epsilon_4 \\
   \epsilon_6 & \rightarrow \epsilon_5 \\
   \epsilon_6 & \rightarrow \epsilon_4 \\
   \epsilon_8 & \rightarrow \epsilon_7 \\
   \epsilon_9 & \rightarrow \epsilon_8 \\
   \epsilon_9 & \rightarrow \epsilon_7 
   \end{align*}
   \]

   The order in which we create the covariances is unimportant. We dragged each covariance from right to left because the bow of the covariance is outward when we drag in a clockwise direction and inward when we drag in a counterclockwise direction. Had we connected the opposite way, we would have needed to use the Contextual Toolbar to mirror the bow of the covariances.

9. Correlate the latent factors.
   a. Select the Add covariance tool, $\text{Add covariance}$.  
   b. Click in the $P_{ar}$ oval and drag a covariance to the $S_{zt}$ oval.
   c. Click in the $S_{zt}$ oval and drag a covariance to the $S_{zd}$ oval.
   d. Click in the $P_{ar}$ oval and drag a covariance to the $S_{zd}$ oval.
10. Clean up.
   If you do not like where a covariance has been connected to its variable, use the Select tool, \( \text{Select} \), to click on the covariance, and then simply click on where it connects to an oval and drag the endpoint. You can also change the bow of the covariance by dragging the control point that extends from one end of the selected covariance.

11. Estimate.
   Click on the \textbf{Estimate} button, \( \text{Estimate} \), in the Standard Toolbar, and then click on \textbf{OK} in the resulting \textit{SEM estimation options} dialog box.

12. Show standardized estimates.
   From the SEM Builder menu, select \textbf{View} > \textbf{Standardized estimates}.
