Example 8 — Testing that coefficients are equal, and constraining them

Description

This example continues where [SEM] Example 7 left off, where we typed

```
use https://www.stata-press.com/data/r16/sem_sm1
.ssd describe
.notes
.sem (r_occasp <- f_occasp r_intel r_ses f_ses) ///
    (f_occasp <- r_occasp f_intel f_ses r_ses), ///
cov(e.r_occasp*e.f_occasp) standardized
.estat stable
.estat teffects
```

Remarks and examples

Remarks are presented under the following headings:

- Using test to evaluate adding constraints
- Refitting the model with added constraints
- Using estat scoretests to test whether constraints can be relaxed

We want to show you how to evaluate potential constraints after estimation, how to fit a model with constraints, and how to evaluate enforced constraints after estimation.

Obviously, in a real analysis, if you evaluated potential constraints after estimation, there would be no reason to evaluate enforced constraints after estimation, and vice versa.

Using test to evaluate adding constraints

In this model of respondents and corresponding friends, it would be surprising if the coefficients relating friends’ characteristics to respondents’ occupational aspirations and vice versa were not equal. It would also be surprising if coefficients relating a respondent’s characteristics to his occupational aspirations were not equal to those of his friends’ characteristics to his occupational aspirations. The paths that we suspect should be equal are

- `r_intel -> r_occasp`
- `r_ses -> r_occasp`
- `f_ses -> r_occasp`
- `f_occasp -> r_occasp`
- `f_intel -> f_occasp`
- `f_ses -> f_occasp`
- `r_ses -> f_occasp`
- `r_occasp -> f_occasp`

You are about to learn that to test whether those paths have equal coefficients, you type

```
.test (_b[r_occasp:r_intel]==_b[f_occasp:f_intel]) ///
      (_b[r_occasp:r_ses]==_b[f_occasp:f_ses]) ///
      (_b[r_occasp:f_ses]==_b[f_occasp:r_ses]) ///
      (_b[r_occasp:f_occasp]==_b[f_occasp:r_occasp])
```
Example 8 — Testing that coefficients are equal, and constraining them

In Stata, \texttt{\_b[]} is how one accesses the estimated parameters. It is difficult to remember what the names are. To determine the names of the parameters, replay the \texttt{sem} results with the \texttt{coeflegend} option:

\begin{verbatim}
  . sem, coeflegend
  Structural equation model Number of obs = 329
  Estimation method = ml
  Log likelihood = -2617.0489

  Coef. Legend
  Structural
  r_occasp .2773441 _b[r_occasp:f_occasp]
  f_occasp .2854766 _b[r_occasp:r_intel]
  r_intel .1570082 _b[r_occasp:r_ses]
  r_ses .0973327 _b[r_occasp:f_ses]
  f_ses .2118102 _b[f_occasp:r_occasp]
  f_intel .0794194 _b[f_occasp:r_ses]
  r_ses .1681772 _b[f_occasp:f_ses]
  f_ses .3693682 _b[f_occasp:f_intel]
  var(e.r_occasp) .6868304 _b[var(e.r_occasp)]
  var(e.f_occasp) .6359151 _b[var(e.f_occasp)]
  cov(e.r_occasp, e.f_occasp) -.1536992 _b[cov(e.r_occasp,e.f_occasp)]

  LR test of model vs. saturated: chi2(0) = 0.00, Prob > chi2 = .
\end{verbatim}

With the parameter names at hand, to perform the test, we can type

\begin{verbatim}
  . test (_b[r_occasp:r_intel] == _b[f_occasp:f_intel])
  > (_b[r_occasp:r_ses] == _b[f_occasp:f_ses])
  > (_b[r_occasp:f_ses] == _b[f_occasp:r_ses])
  > (_b[r_occasp:f_occasp] == _b[f_occasp:r_occasp])
  ( 1) [r_occasp]r_intel - [f_occasp]f_intel = 0
  ( 2) [r_occasp]r_ses - [f_occasp]f_ses = 0
  ( 3) [r_occasp]f_ses - [f_occasp]r_ses = 0
  ( 4) [r_occasp]f_occasp - [f_occasp]r_occasp = 0
  chi2( 4) = 1.61
  Prob > chi2 = 0.8062
\end{verbatim}

We cannot reject the constraint, just as we expected.
Refitting the model with added constraints

We could refit the model with these constraints by typing

```stata
sem (r_occasp <- f_occasp@b1 r_intel@b2 r_ses@b3 f_ses@b4)>
(f_occasp <- r_occasp@b1 f_intel@b2 f_ses@b3 r_ses@b4),
    cov(e.r_occasp*e.f_occasp)
```

Endogenous variables

Observed: r_occasp f_occasp

Exogenous variables

Observed: r_intel r_ses f_ses f_intel

LR test of model vs. saturated: chi2(4) = 1.64, Prob > chi2 = 0.8010

Using estat scoretests to test whether constraints can be relaxed

```stata
. estat scoretests
(no score tests to report; all chi2 values less than 3.841458820694123)```
No tests were reported because no tests were individually significant at the 5% level. We can obtain all the individual tests by adding the \texttt{minchi2(0)} option, which we can abbreviate to \texttt{min(0)}:

\begin{verbatim}
. estat scoretests, min(0)
Score tests for linear constraints
   ( 1) [r_occasp]f_occasp - [f_occasp]r_occasp = 0
   ( 2) [r_occasp]r_intel - [f_occasp]f_intel = 0
   ( 3) [r_occasp]r_ses - [f_occasp]f_ses = 0
   ( 4) [r_occasp]f_ses - [f_occasp]r_ses = 0
\end{verbatim}

\begin{tabular}{l|ccc}
   & chi2  & df & P>chi2 \\
\hline
( 1) & 0.014 & 1 & 0.91 \\
( 2) & 1.225 & 1 & 0.27 \\
( 3) & 0.055 & 1 & 0.81 \\
( 4) & 0.136 & 1 & 0.71 \\
\end{tabular}

Notes:

1. When we began this example, we used \texttt{test} to evaluate potential constraints that we were considering. We obtained an overall $\chi^2(4)$ statistic of 1.61 and thus could not reject the constraints at any reasonable level.
2. We then refit the model with those constraints.
3. For pedantic reasons, now we use \texttt{estat scoretests} to evaluate relaxing constraints included in the model. \texttt{estat scoretests} does not report a joint test. You cannot sum the $\chi^2$ values to obtain a joint test statistic. Thus we learn only that the individual constraints should not be relaxed at reasonable confidence levels.
4. Thus when evaluating multiple constraints, it is better to fit the model without the constraints and use \texttt{test} to evaluate them jointly.
