

# Contents

intro	Introduction to spatial data and SAR models
intro 1	A brief introduction to SAR models
intro 2	The W matrix
intro 3	Preparing data for analysis
intro 4	Preparing data: Data with shapefiles
intro 5	Preparing data: Data containing locations (no shapefiles)
intro 6	Preparing data: Data without shapefiles or locations
intro 7	Example from start to finish
intro 8	The Sp estimation commands
estat moran	Moran test of residual correlation with nearby residuals
grmap	Graph choropleth maps
spbalance	Make panel data strongly balanced
spcompress	Compress Stata-format shapefile
spdistance	Calculator for distance between places
spgenerate	Generate new variables containing spatial lags
spivregress	Spatial autoregressive models with endogenous covariates
spivregress postestimation	Postestimation tools for spivregress
spmatrix	Categorical guide to the spmatrix command
spmatrix copy	Copy spatial weighting matrix stored in memory
spmatrix create	Create standard weighting matrices
spmatrix drop	List and delete weighting matrices stored in memory
spmatrix export	Export weighting matrix to text file
spmatrix fromdata	Create custom weighting matrix from data
spmatrix import	Import weighting matrix from text file
spmatrix matafromsp	Copy weighting matrix to Mata
spmatrix normalize	Normalize weighting matrix
spmatrix note	Put note on weighting matrix, or display it
spmatrix save	Save spatial weighting matrix to file
spmatrix spfrommata	Copy Mata matrix to Sp
spmatrix summarize	Summarize weighting matrix stored in memory
spmatrix use	Load spatial weighting matrix from file
spmatrix userdefined	Create custom weighting matrix
spregress	Spatial autoregressive models
spregress postestimation	Postestimation tools for spregress
spset	Declare data to be Sp spatial data
spshape2dta	Translate shapefile to Stata format
spxtregress	Spatial autoregressive models for panel data
spxtregress postestimation	Postestimation tools for spxtregress
