

**ml for svy** — Maximum pseudolikelihood estimation for survey data

[Remarks and examples](#)

[Reference](#)

[Also see](#)

## Remarks and examples

[stata.com](#)

Stata's `ml` command can fit maximum likelihood–based models for survey data. Many `ml`-based estimators can now be modified to handle one or more stages of clustering, stratification, sampling weights, finite population correction, calibration, poststratification, and subpopulation estimation. See [\[R\] ml](#) for details.

See [\[P\] program properties](#) for a discussion of the programming requirements for an estimation command to work with the `svy` prefix. See [Gould, Pitblado, and Poi \(2010\)](#) for examples of community-contributed estimation commands that support the `svy` prefix.

### ► Example 1: User-written survey regression

The `ml` command requires a program that computes likelihood values to perform maximum likelihood. Here is a likelihood evaluator used in [Gould, Pitblado, and Poi \(2010\)](#) to fit linear regression models using likelihood from the normal distribution.

```

program mynormal_lf
    version 15.1
    args lnf mu lnsigma
    quietly replace `lnf' = ln(normalden($ML_y1,`mu',exp(`lnsigma')))
end

```

Here we fit a survey regression model using a multistage survey dataset with `ml` and the above likelihood evaluator.

```

. use http://www.stata-press.com/data/r15/multistage
. svyset county [pw=sampwgt], strata(state) fpc(ncounties) || school,
> fpc(nschools)
      pweight: sampwgt
          VCE: linearized
Single unit: missing
  Strata 1: state
           SU 1: county
           FPC 1: ncounties
  Strata 2: <one>
           SU 2: school
           FPC 2: nschools

. ml model lf mynormal_lf (mu: weight = height) /lnsigma, svy

```

```

. ml max
initial:      log pseudolikelihood =      -<inf> (could not be evaluated)
feasible:     log pseudolikelihood = -7.301e+08
rescale:      log pseudolikelihood = -51944380
rescale eq:   log pseudolikelihood = -47565331
Iteration 0:  log pseudolikelihood = -47565331
Iteration 1:  log pseudolikelihood = -41226725 (not concave)
Iteration 2:  log pseudolikelihood = -41221650 (not concave)
Iteration 3:  log pseudolikelihood = -41176159 (not concave)
Iteration 4:  log pseudolikelihood = -41154139 (not concave)
