

svymarkout — Mark observations for exclusion on the basis of survey characteristics

[Description](#)[Syntax](#)[Remarks and examples](#)[Stored results](#)[Also see](#)

Description

`svymarkout` is a programmer's command that resets the values of *markvar* to contain 0 wherever any of the survey-characteristic variables (previously set by [svyset](#)) contain missing values.

Syntax

```
svymarkout [markvar]
```

Remarks and examples

[stata.com](#)

`svymarkout` assumes that *markvar* was created by `marksample` or `mark`; see [\[P\] mark](#). This command is most helpful for developing estimation commands that use `m1` to fit models using maximum pseudolikelihood directly, instead of relying on the `svy` prefix; see [\[P\] program properties](#) for a discussion of how to write programs to be used with the `svy` prefix.

▷ Example 1

```
program mysvyprogram, ...
    ...
    syntax ...
    marksample touse
    svymarkout 'touse'
    ...
end
```

Stored results

`svymarkout` stores the following in `s()`:

Macros

```
s(weight)    weight variable set by svyset
```
