[Syntax](#)  
[Also see](#)

## Description

`collect copy` copies a collection in memory into a new collection.

## Quick start

Copy existing collection `c1` into collection `c2`

```
collect copy c1 c2
```

As above, but overwrite `c2` if it exists

```
collect copy c1 c2, replace
```

## Menu

Statistics > Summaries, tables, and tests > Tables and collections > Copy collection

## Syntax

```
collect copy cname newcname [ , replace ]
```

where *cname* is the name of an existing collection and *newcname* is the name of the collection to be created.

## Option

`replace` permits `collect copy` to overwrite an existing collection. `replace` is required if *newcname* already exists and is not empty.

## Remarks and examples

[stata.com](#)

`collect copy` copies an existing collection into a new collection. This new collection becomes the [current collection](#), the collection to which subsequent `collect` subcommands will be applied.

## Stored results

`collect copy` stores the following in `s()`:

Macros  
`s(current)`      name of current collection
