

collect style clear — Clear all collection styles

[Description](#)[Syntax](#)[Remarks and examples](#)[Stored results](#)[Also see](#)

Description

`collect style clear` clears all collection styles defined in the current (active) collection, including the default style, and specifies that `collect` use an empty style.

Syntax

```
collect style clear
```

Remarks and examples

[stata.com](#)

`collect style clear` clears all collection styles defined in the [current collection](#), including the default style, and specifies that `collect` use an empty style. Note that this command does not affect the styles for other collections you have in memory. This command is rarely used because a table produced using the empty style will typically need many style edits to be complete. For instance, with the empty style, a table will display the title for each dimension, which is typically not needed.

If you are in the process of creating a table and have made several changes to the appearance style but you wish to return to the default style, you can load the default style with [collect style use](#).

Stored results

`collect style clear` stores the following in `s()`:

Macros

```
s(collection) name of collection
```
