Description

`forecast clear` removes the current forecast model from memory.

Syntax

```
forecast clear
```

Remarks and examples

For an overview of the `forecast` commands, see [TS] `forecast`. This manual entry assumes you have already read that manual entry. `forecast` allows you to have only one model in memory at a time. You use `forecast clear` to remove the current model from memory. Forecast models themselves do not consume a significant amount of memory, so there is no need to clear a model from memory unless you intend to create a new one. An alternative to `forecast clear` is the `replace` option with `forecast create`.

Calling `forecast clear` when no forecast model exists in memory does not result in an error.
