irf cgraph — Combined graphs of IRFs, dynamic-multiplier functions, and FEVDs

DescriptionQuick startMenuSyntaxOptionsRemarks and examplesStored resultsAlso see

Description

irf cgraph makes a graph or a combined graph of IRF results. A graph is drawn for specified combinations of named IRF results, impulse variables, response variables, and statistics. irf cgraph combines these graphs into one image, unless separate graphs are requested.

irf cgraph operates on the active IRF file; see [TS] irf set.

Quick start

Combine graphs of an orthogonalized IRF myirf and cumulative IRF mycirf for dependent variables y1 and y2

irf cgraph (myirf y1 y2 oirf) (mycirf y1 y2 cirf)

Same as above, but suppress confidence bands and add a title

```
irf cgraph (myirf y1 y2 oirf) (mycirf y1 y2 cirf), noci ///
title("My Title")
```

Note: irf commands can be used after var, svar, ivsvar, vec, arima, arfima, lpirf, ivlpirf, dsge, dsgenl, or xtvar; see [TS] var, [TS] var svar, [TS] var ivsvar, [TS] vec, [TS] arima, [TS] arfima, [TS] lpirf, [TS] ivlpirf, [DSGE] dsge, [DSGE] dsgenl, or [XT] xtvar.

Syntax

 $irf cgraph (spec_1) [(spec_2) \dots [(spec_N)]] [, options]$

where $(spec_k)$ is

(*irfname impulsevar responsevar stat* [, *spec_options*])

irfname is the name of a set of IRF results in the active IRF file. *impulsevar* should be specified as an endogenous variable for all statistics except dm and cdm; for those, specify as an exogenous variable. *responsevar* is an endogenous variable name. *stat* is one or more statistics from the list below:

stat	Description
Main	
irf	impulse-response function
oirf	orthogonalized impulse-response function
dm	dynamic-multiplier function
cirf	cumulative impulse-response function
coirf	cumulative orthogonalized impulse-response function
cdm	cumulative dynamic-multiplier function
fevd	Cholesky forecast-error variance decomposition
sirf	structural impulse-response function
csirf	cumulative structural impulse-response function
sfevd	structural forecast-error variance decomposition

Notes: 1. No statistic may appear more than once.

2. If confidence intervals are included (the default), only two statistics may be included.

3. If confidence intervals are suppressed (option noci), up to four statistics may be included.

spec_options	Description
Main	
noci	suppress confidence bands
<u>l</u> evel(#)	set confidence level; default is level(95)
<u>lst</u> ep(#)	use # for first step
<u>ust</u> ep(#)	use # for maximum step
Plot	
<pre>plot#opts(cline_options)</pre>	affect rendition of the line plotting the #stat
Cl plot <u>ci#</u> opts(<i>area_options</i>)	affect rendition of the confidence interval for the #stat

spec_options may be specified within a graph specification, globally, or in both. When specified in a graph specification, spec_options affect only the specification in which they are used. When supplied globally, spec_options affect all graph specifications. When supplied in both places, options in the graph specification take precedence.

options	Description
set(<i>filename</i>)	make <i>filename</i> active
Graph options	
<u>in</u> dividual	graph each combination individually
combine_options	affect appearance of combined graph
graph_options	any options other than by() documented in [G-3] twoway_options

irf cgraph — Combined graphs of IRFs, dynamic-multiplier functions, and FEVDs 3

collect is allowed; see [U] 11.1.10 Prefix commands.

Options

set(filename) specifies the file to be made active; see [TS] irf set() is not specified, the active
file is used.

spec_options affect the rendition of the specification and include the following:

Main

noci suppresses graphing the confidence interval for each statistic. noci is assumed when the model was fit by vec because no confidence intervals were estimated.

level (#) specifies the default confidence level, as a percentage, for confidence intervals, when they are reported. The default is level(95) or as set by set level; see [U] **20.8 Specifying the width** of confidence intervals. The value set of an overall level() can be overridden by the level() inside a $(spec_k)$.

lstep(#) specifies the first step, or period, to be included in the graph. lstep(0) is the default.

ustep(#), $\# \ge 1$, specifies the maximum step, or period, to be included in the graph.

Plot

plot1opts(cline_options), ..., plot4opts(cline_options) affect the rendition of the plotted statistics. plot1opts() affects the rendition of the first statistic; plot2opts(), the second; and so on. cline_options are as described in [G-3] cline_options.

CI plot

cilopts1(area_options) and cilopts2(area_options) affect the rendition of the confidence intervals for the first (cilopts()) and second (cilopts()) statistics. See [TS] irf graph for a description of this option and [G-3] area_options for the suboptions that change the look of the CI.

Graph options

individual specifies that each graph be displayed individually. By default, irf cgraph combines the subgraphs into one image.

combine_options affect the appearance of the combined graph; see [G-2] graph combine.

graph_options are any of the options documented in [G-3] *twoway_options*, excluding by(). These include options for titling the graph (see [G-3] *title_options*) and for saving the graph to disk (see [G-3] *saving_option*).

Remarks and examples

If you have not read [TS] irf, please do so.

The relationship between irf cgraph and irf graph is syntactically and conceptually the same as that between irf ctable and irf table; see [TS] **irf ctable** for a description of the syntax.

irf cgraph is much the same as using irf graph to make individual graphs and then using graph combine to put them together. If you cannot use irf cgraph to do what you want, consider the other approach.

Example 1

You have previously issued the commands:

```
. use https://www.stata-press.com/data/r19/lutkepohl2
. mat a = (., 0, 0\0,.,0\.,.,)
. mat b = I(3)
. svar dln_inv dln_inc dln_consump, aeq(a) beq(b)
. irf create modela, set(results3) step(8)
. svar dln_inc dln_inv dln_consump, aeq(a) beq(b)
. irf create modelb, step(8)
```

You now type

```
. irf cgraph (modela dln_inc dln_consump oirf sirf)
> (modelb dln_inc dln_consump oirf sirf)
> (modela dln_inc dln_consump fevd sfevd, lstep(1))
> (modelb dln_inc dln_consump fevd sfevd, lstep(1)),
> title("Results from modela and modelb")
```

Results from modela and modelb

4

Stored results

irf cgraph stores the following in r():		
Scalars		
r(k)	number of specific graph commands	
Macros		
r(individual)	individual, if specified	
r(save)	<i>filename</i> , replace from saving() option for combined graph	
r(name)	name, replace from name() option for combined graph	
r(title)	title of the combined graph	
r(save#)	filename, replace from saving() option for individual graphs	
r(name#)	name, replace from name() option for individual graphs	
r(title#)	title for the #th graph	
r(ci#)	level applied to the #th confidence interval or noci	
r(response#)	response specified in the #th command	
r(impulse#)	impulse specified in the #th command	
r(irfname#)	IRF name specified in the #th command	
r(stats#)	statistics specified in the #th command
