5 Flavors of Stata

Contents
5.1 Platforms
5.2 Stata/MP, Stata/SE, or Stata/IC
   5.2.1 Determining which version you own
   5.2.2 Determining which version is installed
5.3 Size limits of Stata/MP, SE, and IC
5.4 Speed comparison of Stata/MP, SE, and IC
5.5 Feature comparison of Stata/MP, SE, and IC

5.1 Platforms

Stata is available for a variety of systems, including

- Stata for Windows, 64-bit x86-64
- Stata for Mac, 64-bit x86-64
- Stata for Linux, 64-bit x86-64

Which version of Stata you run does not matter—Stata is Stata. You instruct Stata in the same way and Stata produces the same results, right down to the random-number generator. Even files can be shared. A dataset created on one computer can be used on any other computer, and the same goes for graphs, programs, or any file Stata uses or produces. Moving files across platforms is simply a matter of copying them; no translation is required.

Some computers, however, are faster than others. Some computers have more memory than others. Computers with more memory, and faster computers, are better.

When you purchase Stata, you may install it on any of the above platforms. Stata licenses are not locked to a single operating system.

5.2 Stata/MP, Stata/SE, or Stata/IC

Stata is available in three flavors, although perhaps sizes would be a better word. The flavors are, from largest to smallest, Stata/MP, Stata/SE, and Stata/IC.

Stata/MP is the multiprocessor version of Stata. It runs on multiple CPUs or on multiple cores, from 2 to 64. Stata/MP uses however many cores you tell it to use (even one), up to the number of cores for which you are licensed. Stata/MP is the fastest version of Stata. Even so, all the details of parallelization are handled internally and you use Stata/MP just like you use any other flavor of Stata. You can read about how Stata/MP works and see how its speed increases with more cores in the Stata/MP performance report at https://www.stata.com/statamp/report.pdf.

Stata/SE is like Stata/MP, but for single CPUs. Stata/SE will run on multiple CPUs or multiple-core computers, but it will use only one CPU or core. SE stands for special edition.

In addition to being the fastest version of Stata, Stata/MP is also the largest. Stata/MP allows up to 1,099,511,627,775 observations in theory, but you can undoubtedly run out of memory first. You may have up to 120,000 variables with Stata/MP. Statistical models may have up to 11,000 variables.
Stata/SE allows up to 2,147,583,647 observations, assuming you have enough memory. You may have up to 32,767 variables, and, like Stata/MP, statistical models may have up to 11,000 variables.

Stata/IC is standard Stata. Up to 2,147,583,647 observations and 2,048 variables are allowed, depending on memory. Statistical models may have up to 800 variables.

5.2.1 Determining which version you own

Check your License and Activation Key. Included with every copy of Stata is a License and Activation Key that contains codes that you will input during installation. This determines which flavor of Stata you have and for which platform.

Contact us or your distributor if you want to upgrade from one flavor to another. Usually, all you need is an upgraded License and Activation Key with the appropriate codes. All flavors of Stata are on the same DVD.

If you purchased one flavor of Stata and want to use a lesser version, you may. You might want to do this if you had a large computer at work and a smaller one at home. Please remember, however, that you have only one license (or however many licenses you purchased). You may, both legally and ethically, install Stata on both computers and then use one or the other, but you should not use them both simultaneously.

5.2.2 Determining which version is installed

If Stata is already installed, you can find out which Stata you are using by entering Stata as you normally do and typing about:

```
. about
Stata/MP 16 for Windows (64-bit x86-64)
Revision date
Copyright 1985-2019 StataCorp LLC
Total physical memory: 8388608 KB
Available physical memory: 937932 KB
10-user 32-core Stata network perpetual license:
  Serial number: 16
  Licensed to: Alan R. Riley
  StataCorp
```
5.4 Speed comparison of Stata/MP, SE, and IC

We have written a white paper comparing the performance of Stata/MP with Stata/SE; see https://www.stata.com/statamp/report.pdf. The white paper includes command-by-command performance measurements.

In summary, on a dual-core computer, Stata/MP will run commands in 71% of the time required by Stata/SE. There is variation; some commands run in half the time and others are not sped up at all. Statistical estimation commands run in 59% of the time. Numbers quoted are medians. Average performance gains are higher because commands that take longer to execute are generally sped up more.

Stata/MP running on four cores runs in 50% (all commands) and 35% (estimation commands) of the time required by Stata/SE. Both numbers are median measures.

Stata/MP supports up to 64 cores.

Stata/IC is slower than Stata/SE, but those differences emerge only when processing datasets that are pushing the limits of Stata/IC. Stata/SE has a larger memory footprint and uses that extra memory for larger look-aside tables to more efficiently process large datasets. The real benefits of the larger tables become apparent only after exceeding the limits of Stata/IC. Stata/SE was designed for processing large datasets.

The differences are all technical and internal. From the user’s point of view, Stata/MP, Stata/SE, and Stata/IC work the same way.

5.5 Feature comparison of Stata/MP, SE, and IC

The features of all flavors of Stata on all platforms are the same. The differences are in speed and in limits as discussed above. To learn more, type help stata/mp, help stata/se, or help stata/ic.
